

Figure S2.

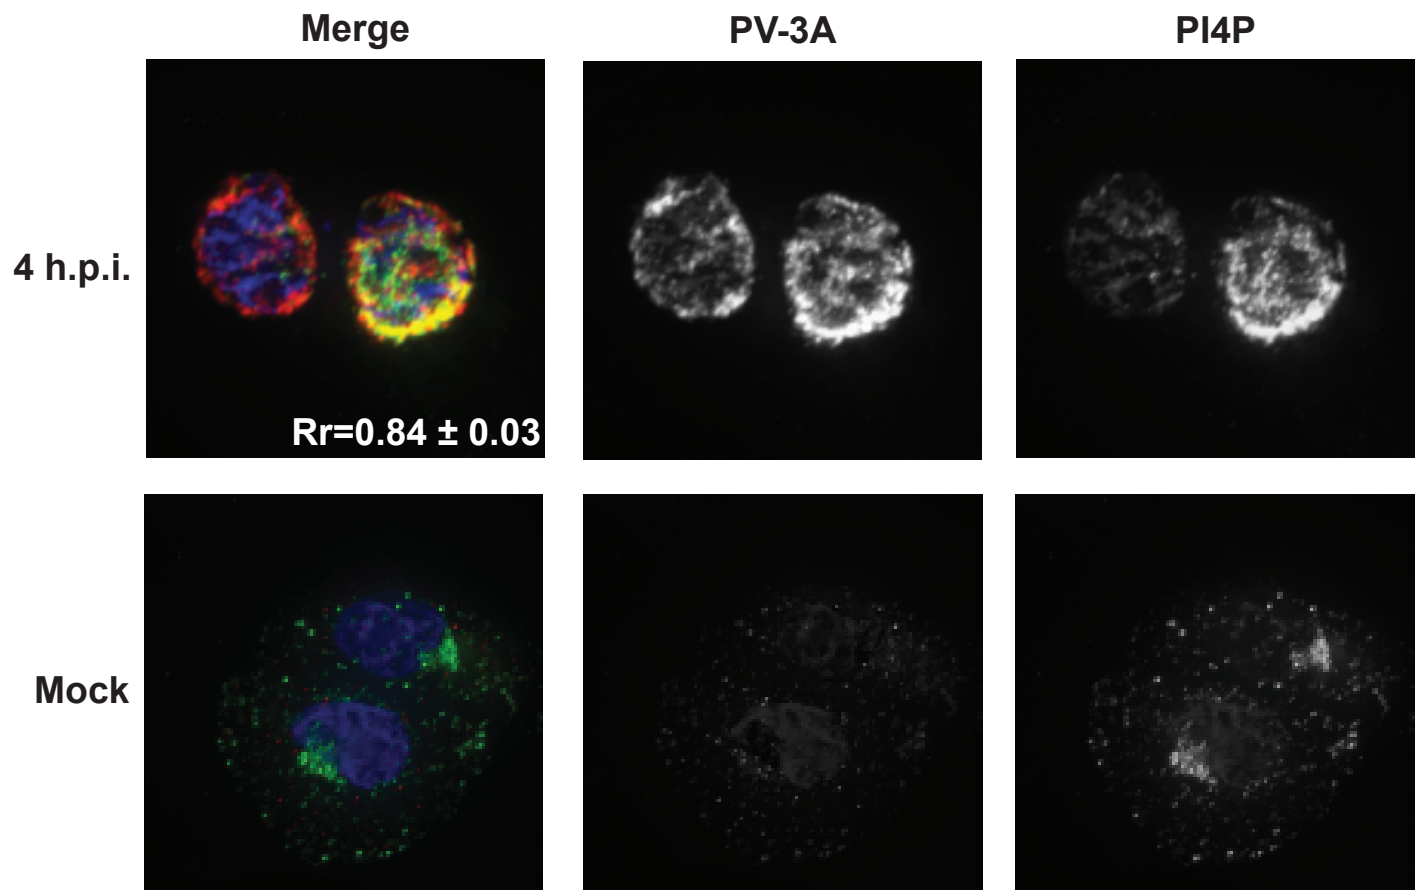

Figure S2. PV-3A co-localizes with phosphatidylinositol-4-phosphate (PI4P) during PV infection. H1-Hela cells were infected at an MOI of 50 pfu/cell, fixed and permeabilized with -20°C Methanol at the indicated times post-infection. Cells were stained with both with a monoclonal antibody against PI4P and a polyclonal antibody against the poliovirus 3A protein.
