

Supplementary Figure 5

Supplementary Figure 5: Proportions of CD4⁺ T_{SCM} cells in HAART-treated patients, elite controllers and HIV-1 negative persons. Proportions of different CD4⁺ T cell subsets in HIV-1 negative persons (n=7), HAART-treated individuals (n=20) and HIV-1 elite controllers (n=18) are shown. HAART-treated patients and elite controllers had undetectable levels of HIV-1 replication for a median of 8 years. Significance was tested using Kruskal-Wallis test followed by post-hoc analysis with Dunn's multiple comparison test (*, ** reflect p<0.05, p<0.01 respectively).
