

Supplementary data

Suppl. figure S1

Confirmation of knock-out *azi1* mutant by RT-PCR.

Total RNA was isolated from 14-day-old seedlings. cDNA samples were amplified with primers for *Actin2* (control) or for *AZI1*.

Suppl. figure S2

Lower AZI1 levels in 35S::*AZI1/mpk3* lines are related to the *mpk3* mutant background.

Proteins were extracted from 14-day-old seedlings originating from crossings of the *AZI1* overexpressing line 11.8 with *mpk3*. AZI1-myc protein was detected by immunoblot analysis after SDS-PAGE. Protein loading was visualised by Coomassie-blue staining. AZI1 X1 and X2 are wildtype for *MPK3*, while *AZI1/mpk3* (two independent lines shown) lack a functional *MPK3* allele. X1 and X2 have undergone the same crossing and seed propagation procedure as *AZI1/mpk3*.

Suppl. figure S3

The overall protein profiles in Arabidopsis wild-type, *azi1*, *mpk3*, 35S::*AZI1* and 35S::*AZI1/mpk3* plants look similar.

Proteins from 14-day-old seedlings of the indicated lines (independent duplicate samples) were extracted in standard extraction buffer B1. 15 µg of the soluble protein fraction was separated by SDS-PAGE and visualised by Coomassie Blue staining.

Suppl. figure S4

Hydrophathy profile of AZI1 and variants carrying dephosphomimetic (alanine, A) or phosphomimetic (aspartate, D) residues at putative MAPK phosphorylation sites (Ser33, Ser41, Ser59, Thr66, Thr70).

Data were computed for the full-length AZI1 protein sequence with or without one of the following replacements:

„AAA“: S33A,S41A,S59A

„DDD“: S33D,S41D,S59D

„AAAAA“:S33A,S41A,S59A,T66A,T70A

„DDDDD“: D,S41D,S59D,T66D,T70D

The **black curve** is the actual profile; the superimposed green curve is a smoothed version of the profile.

Regions that have a favorable free energy of transfer (predicted membrane-located regions) are indicated with horizontal red bars.

Suppl. figure S5

Predicted stability of AZI1 and phosphovariant proteins.

Sequences were submitted to the ExPASyProtParam tool. The computed instability index (II) inversely correlates with protein stability. Proteins with $II < 40$ are predicted as stable. Note the decline in II upon successive exchange of putative phosphorylation sites by phosphomimetic aspartate (D) but not by dephosphomimetic alanine (A) residues.

Suppl. figure S6.

Predicted O-glycosylation sites in AZI1.

The full-length AZI1 protein sequence was analysed using the bioinformatic online tool NetOGlyc, according to which “scores higher than 0.5 are predicted as glycosylated and marked with the string “#POSITIVE” in the comment field”. The relevant region comprising all predicted sites is displayed at the bottom. Nine candidate target sites for O-glycosylation (blue) are contained in the proline-rich domain of AZI1. Five of these (Ser33, Ser41, Ser59, Thr66, Thr70) overlap with putative MAPK target sites (red) (see also figure 1).

Suppl. figure S7

Alignment of *Arabidopsis* AGP31 sequence of residues 98-129, a reportedly strongly glycosylated peptide (Hijazi et al., 2012), with the proline-rich domain of AZI1. Data were generated using the PRALINE software <http://www.ibi.vu.nl/programs/pralinewww/>.

Table S1. Multiple stress-responsive LTPs

Arabidopsis *LTP* genes responding to 6 or more types of abiotic stress, as identified in a functional genomics-based screen (Kant et al. 2008). *Corresponding subfamily of cysteine-rich proteins (CRPs). Members of CRP4820, the only subfamily with strong conservation between monocots and dicots (Silverstein et al. 2007) are highlighted.

Actin2

AZI fo1/re7

Suppl. figure S1

Confirmation of knock-out *azi1* mutant by RT-PCR.

Total RNA was isolated from 14-day-old seedlings. cDNA samples were amplified with primers for *Actin2* (control) or for *AZI1*.

Suppl. figure S2

Lower AZI1 levels in *35S::AZI1/mpk3* lines are related to the *mpk3* mutant background.

Proteins were extracted from 14-day-old seedlings originating from crossings of the *AZI1* overexpressing line 11.8 with *mpk3*. AZI1-myc protein was detected by immunoblot analysis after SDS-PAGE. Protein loading was visualised by Coomassie-blue staining. AZI1 X1 and X2 are wildtype for *MPK3*, while *AZI1/mpk3* (two independent lines shown) lack a functional *MPK3* allele. X1 and X2 have undergone the same crossing and seed propagation procedure as *AZI1/mpk3*

1 Col-O wild type
2 *azi1*
3 35S::*AZI1*
4 35S::*AZI1/mpk3*
5 *mpk3*

Figure S3

The overall protein profiles in Arabidopsis wild-type, *azi1*, *mpk3*, 35S-AZI1 and 35S-AZI1/*mpk3* plants look similar.

Proteins from 14-day-old seedlings of the indicated lines (independent duplicate samples) were extracted in standard extraction bufferA. 15 μg of the soluble protein fraction was separated by SDS-PAGE and visualised by Coomassie Blue staining.

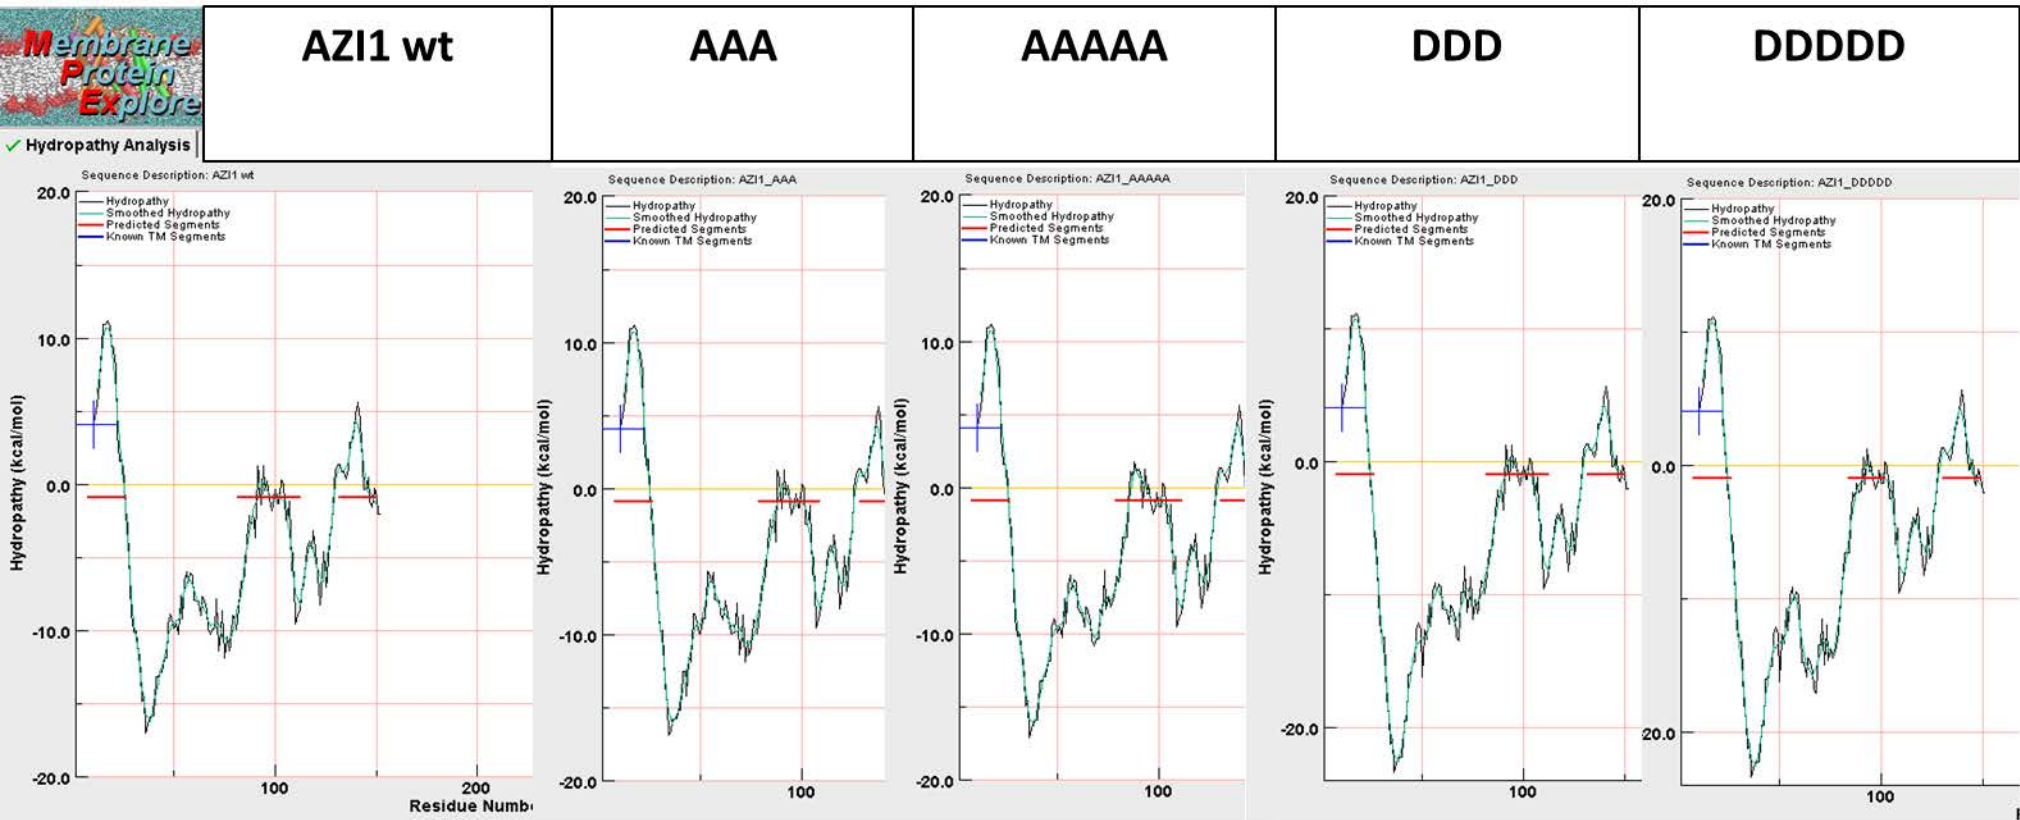

Figure S4

Hydrophathy profile of AZI1 and variants carrying dephosphomimetic (alanine, A) or phosphomimetic (aspartate, D) residues at putative MAPK phosphorylation sites (Ser33, Ser41, Ser59, Thr66, Thr70).

Data were computed for the full-length AZI1 protein sequence with or without one of the following replacements:

„AAA“: S33A,S41A,S59A

„DDD“: S33D,S41D,S59D

„AAAAA“: S33A,S41A,S59A,T66A,T70A

„DDDDD“: D,S41D,S59D,T66D,T70D

The **black curve** is the actual profile; the superimposed green curve is a smoothed version of the profile.

Regions that have a favorable free energy of transfer (predicted membrane-located regions) are indicated with horizontal red bars.

Figure S5

Predicted stability of AZI1 and phosphovariant proteins.

Sequences were submitted to the ExPASyProtParam tool. The computed instability index (II) inversely correlates with protein stability. Proteins with $II < 40$ are predicted as stable. Note the decline in II upon successive exchange of putative phosphorylation sites by phosphomimetic aspartate (D) but not by dephosphomimetic alanine (A) residues.
