NOTE:

For each sequence, its accession number (NCBI) and the ID used in this study is listed. For GH families that were not included in our study '-' is shown.

*In Calderón-Cortés *et al.* [12], *Drosophila melanogaster* is shown to have two GH45 (EC068056 and CO334668) and one GH28 (CO335003). The nucleotide sequences of these two GH45s are 100% identical, and there are only three nucleotide differences between these *D. melanogaster* GH45s and *L. decemlineata* GH45-7 (ADU3351.1) (100% identical in amino acid sequences). The *D. melanogaster* GH28 and *L. decemlineata* GH28-9 (ADU33363.1) are also 100% identical at the nucleotide level. Furthermore, BLAST similarity search against the *D. melanogaster* genome (ver. 5.51; <http://flybase.org>) failed to find any similar sequences. Therefore, we concluded that these are likely misidentifications. GH45 and GH28 are absent in *D. melanogaster*.

**Pauchet *et al.* [22] showed ten GH28 genes (ADU3355.1-ADU3364.1) in *L. decemlineata*. However, we found one more GH28 gene (AEX93414.1, Ldec_GH28-11) in the NCBI NR database.
