

Supplemental Materials and Methods

Patients and Samples

Institutional review board (The Rockefeller University and Weill Cornell Medical College) approval and written informed consent were obtained before enrolling patients to participate in this study. The study was performed in adherence with the Declaration of Helsinki Principles. Cutaneous SCC samples were obtained from debulking during Mohs micrographic surgery. All tumors were obtained from sun-exposed skin. Normal specimens were obtained from non-sun-exposed areas of patients without skin cancer.

LCM

SCC (n=10) and normal skin (n=10) were subjected to LCM. Frozen tissue sections were cut at 8.0 μ m in a -20°C cryostat and placed on membrane mounted metal frame slides (Molecular Machines and Industries, Haslett, MI), then stored at -80°C. Slides were stained with abbreviated Hematoxylin & Eosin (H&E) prior to LCM. LCM was performed following the manufacturer's protocol for the CellCut system (Molecular Machines and Industries). Laser captured tissues were collected in 100.0 μ l of RLT buffer (QIAGEN, Valencia, CA) containing 1% β -mercaptoethanol (Fisher Scientific, Fair Lawn, NJ) within 2 hours after starting H&E staining in order to prevent RNA degradation. The samples in RLT buffer were stored at -80°C until RNA extraction was performed. Normal skin samples used in this study as a reference came from our previous study (Kennedy-Crispin *et al*, 2012)

RNA extraction and quantification

Total RNA from LCM samples was extracted into 24.0 μ l of RNase free water using the RNeasy Micro Kit (QIAGEN) according to the manufacturer's protocol with on-column DNase digestion. Quantitative reverse transcriptase polymerase chain reaction (qRT-PCR) for RPLP0/hARP using TaqMan EZ PCR Core Reagent (Applied Biosystems, Foster City, CA) was performed in order to estimate the concentration of RNA. Briefly, 1.0 μ l of total RNA was diluted into 2.0 μ l of RNase free water. One μ l of diluted total RNA was applied into a well with 49.0 μ l of RT-PCR reaction buffer including 3.0 μ l of primers and probe mix. Serial dilutions of total RNA (ranging from 2000.0 pg/ μ l to 1.0 pg/ μ l) extracted from human skin tissues were prepared and used to generate the standard curve. The samples were amplified and quantified by 7900HT Fast Real-Time PCR System (Applied Biosystems) using the following thermal cycler conditions: 2 minutes at 50°C; 30 minutes at 60°C; 5 minutes at 95°C; and 45 cycles of 15 seconds at 95°C followed by 60 seconds at 62°C. Assays were performed in triplicate. The quality of extracted RNA was evaluated using Agilent Bioanalyzer (Agilent, Santa Clara, CA).

RNA amplification and hybridization

One ng of total RNA was subjected to Affymetrix two-cycle cDNA synthesis (Affymetrix, Santa Clara, CA), with a slight modification described previously

(Mitsui *et al*, 2012). Biotin labeling of cRNA transcripts was done with the GeneChip IVT Labeling Kit (Affymetrix). Fifteen µg of biotin-labeled RNA was fragmented and hybridized to Human Genome U133 A2.0 arrays (Affymetrix) and washed, stained, and scanned according to the manufacturer's protocol. The data have been deposited at the Gene Expression Omnibus repository (GSE42677).

SCC Cell lines

Two human cutaneous SCC cell lines were used in this study. A431 cell line was purchased from ATCC (Manassas, VA). A431 cells were established from an 85-year-old female. This cell line forms growing subcutaneous tumors in immunosuppressed mice (Giard DJ, *et al.* 1973). The histology showed a poorly differentiated SCC. This cell line is able to form lung metastasis when injected intravenously (Price *et al.* 1988). SCC13 cells were kindly provided by professor Rheinwald (Harvard Medical Center, MA). SCC13 cells were established from a tumor on a face of a 56-year-old female. This cell line formed a tumor in subcutaneous regions of nude mice. The histology showed large differentiating cysts with a more organized structure as well as regions of typical SCC, but these cells lack invasive capacity beyond the mouse dermis (Rheinwald and Beckett, 1981).

Cell culture

Dulbecco's Modified Eagle Medium (DMEM), High Glucose (Gibco, Grand Island, NY) supplemented with 10% Fetal Bovine Serum (ATCC) was used to grow A431 and HaCaT cells. SCC13 cells were maintained in the Keratinocyte serum free medium supplemented with 25 µg/ml bovine pituitary extract, 0.2 ng/ml epidermal growth factor, and 0.4mmol/L CaCl₂ (all from Gibco). The cells were seeded at a density of 1,000 cells/cm² in the appropriate medium in 6-well plate at 37°C in a humidified atmosphere containing 5% CO₂. The cells were starved in empty media for 24 hours when they reached more than 90% confluence, followed by stimulation with one of following cytokines for 24 hours: IL-20 (100ng/ml, R&D, Minneapolis, MN), IL-24 (40ng/ml or 100ng/ml, R&D), TNF-α (10ng/ml), TGF-α (20ng/ml), and IFN-γ (20ng/ml). After cytokine treatment, the cells were lysed in RLT buffer (QIAGEN) containing 1% β-mercaptoethanol (Fisher Scientific), and total RNA was extracted.

Wound healing assay

A431 cells were seeded into a 12 well flask in 2 ml of DMEM supplemented with 10%FBS. When they reached more than 90% confluence, a wound was using a 200µl pipet tip. The cells were washed twice with PBS and 2ml of DMEM supplemented with either 0.1% or 10% FBS was added. An MMP7Ab (Ito *et al.* 2007) (R&D systems) was added to the media at the indicated concentrations (PBS only, 20ng/ml, 200ng/ml, and 2000ng/ml). The wounds were photographed at 0, 12, 24, and 36 hours. The area of wound was estimated by measuring pixels using the ImageJ program (NIH, Bethesda, MD). Two independent areas were photographed from single wound of each condition at each time point and

average of those two areas were taken. The experiment was repeated three times. A percent of wound closure was calculated using the following equation:

$$[\% \text{ wound closure}] = ([\text{pixels at } 0\text{h}] - [\text{pixels at each time point}]) / [\text{pixels at } 0\text{h}]$$

Pre-amplification quantitative RT-PCR

Pre-amplification quantitative RT-PCR technique was used for measuring 23 MMPs, IL-20, IL-24, IL20 receptor (IL20R)1, IL20R2, and IL22R1 values in total RNA extracted from laser captured samples according to the company's instruction (Applied Biosystems). This technique allows us to evaluate up to 100 targets from as low as 1 ng of cDNA by quantitative PCR measurement. Briefly, five ng of total RNA was subjected to first-strand cDNA synthesis using High Capacity cDNA Reverse Transcription Kits (Applied Biosystems). The resulting cDNA was subjected to 14 cycles of pre-amplification using TaqMan PreAmp Master Mix Kit (Applied Biosystems) with desired pooled assay mix (Applied Biosystems). The Gene Amp PCR System 9700 (Applied Biosystems) was used for pre-amplification reaction with the following thermal cycler conditions: 10 min at 95°C and 14 cycles of 15 seconds at 95°C followed by 4 min at 60°C. 12.5 μ l of pre-amplified cDNA was then used for quantitative PCR reaction using TaqMan Gene Expression Master Mix (Applied Biosystems). The 7900HT Fast Real-Time PCR System was used for PCR reaction, and the thermal cycler conditions were as follows: 2 minutes at 50°C, 5 minutes at 95°C, and 40 cycles of 15 seconds at 95°C followed by 60 seconds at 60°C. All reactions were performed in duplicate. All data were normalized to RPLP0/hARP. Primers and probes used in this experiment are listed in Table S7.

Quantitative RT-PCR

Regular TaqMan RT-PCR method was used to detect the MMP7, MMP13, and IL-24 signals in total RNA extracted from cultured cells. Ten ng of total RNA was used for each reaction. The TaqMan EZ PCR core reagents (Applied Biosystems) were used with the 7900HT Fast Real-Time PCR System. Thermal cycler conditions were as follows: 2 minutes at 50°C, 30 minutes at 60°C, 5 minutes at 95°C, and 40 cycles of 15 seconds at 95°C followed by 60 seconds at 60°C. All reagents were purchased from Applied Biosystems. All data were normalized to RPLP0/hARP. For the analysis, a value of 0 (no amplification) was replaced with 25% of the minimum quantity for each gene in order to obtain logarithmic values. Primers and probes used in this experiment are listed in Table S8.

Immunohistochemistry (IHC)

Frozen skin sections were prepared. Tissue sections were incubated with primary antibodies at 4°C overnight. Secondary biotin-labeled horse anti-mouse antibody (Vector Laboratories, Burlingame, CA) was amplified with avidin-biotin complex (Vector Laboratories). We used the chromogen 3-Amino-9 ethylcarbazole (Sigma-Aldrich, St. Louis, MO). Antibodies used in this experiment are listed in Table S7.

Statistical analysis

cDNA microarray data were analyzed using R/Bioconductor packages (www.r-project.org). The Harshlight package (Suárez-Fariñas *et al*, 2005) was used to scan Affymetrix chips for spatial artifacts. Expression values were obtained using gcrma algorithm. Probe-sets with standard deviation larger than 0.2 and expression values above 3 for at least 3 samples were included in the analysis. Expression values were linearly modeled in the *limma* package framework. For the comparison of interest, the moderated t-test was used to assess differential expression. P-values for each comparison were adjusted for multiple hypotheses using the Benjamini-Hochberg approach. Genes with false discovery rate (FDR)<0.05 and fold change (FCH)>3.0 were considered as differentially expressed genes (DEGs).

Statistical analysis of all RT-PCR data was performed using Graphpad Prism ver.5 (GraphPad Software, La Jolla, USA). One-way ANOVA followed by Tukey's multiple comparison correction was performed. A $p<0.05$ was considered as statistically significant.

MMP7	0.23	1.26	0.08	0.09	0.40	0.0006
MMP12	0.26	1.30	0.09	0.10	0.45	0.0008
MMP3	0.24	1.27	0.08	0.09	0.42	0.0011
MMP11	0.47	1.60	0.17	0.17	0.86	0.0015
MMP17	1.03	2.81	0.38	0.34	1.88	0.0024
MMP9	0.66	1.94	0.25	0.22	1.22	0.0025
MMP25	0.54	1.72	0.23	0.14	1.05	0.0074
MMP2	0.46	1.59	0.20	0.11	0.90	0.0083
MMP16	0.19	1.20	0.08	0.04	0.36	0.0133
MMP24	0.53	1.70	0.23	0.09	1.03	0.0175
MMP19	0.46	1.59	0.22	0.06	0.94	0.0224
MMP15	0.80	2.22	0.52	-0.15	1.95	0.1021
MMP27	0.24	1.27	0.16	-0.07	0.57	0.1246
MMP20	0.47	1.60	0.33	-0.15	1.23	0.1384
MMP14	0.61	1.84	0.43	-0.20	1.53	0.1406
MMP28	-0.39	0.68	0.28	-1.00	0.14	0.1487
MMP21	-0.12	0.89	0.09	-0.30	0.05	0.1824
MMP23B	-0.21	0.81	0.32	-0.90	0.40	0.5094
MMP8	-0.12	0.89	0.27	-0.71	0.46	0.6571
MMP26	NA	NA	NA	NA	NA	NA

Proportional odds model indicates that gene expression of MMPs increases the odds of being in a higher path towards malignancy. A $p<0.05$ was considered as significant. MMP26 could not be evaluated since the expression of this gene in all normal epidermis and AK regions were not detected at all.

IL24	R&D systems	283123	IgG2b	1:100

All antibodies used in this experiment were mouse monoclonal.

Figure S1**Figure S1. MMP expression across regions in SCC.**

mRNA expression levels of MMPs were examined by preamplification qRT-PCR across microdissected tissues from cutaneous SCC. A *p* value for each MMP was obtained among four regions using one-way ANOVA with Tukey's correction. The resultant *p* values are shown in parentheses. A line between two bar indicates statistical significance between two regions.

Figure S2

Correlation of FCH between gene chip and pre-amp RT-PCR

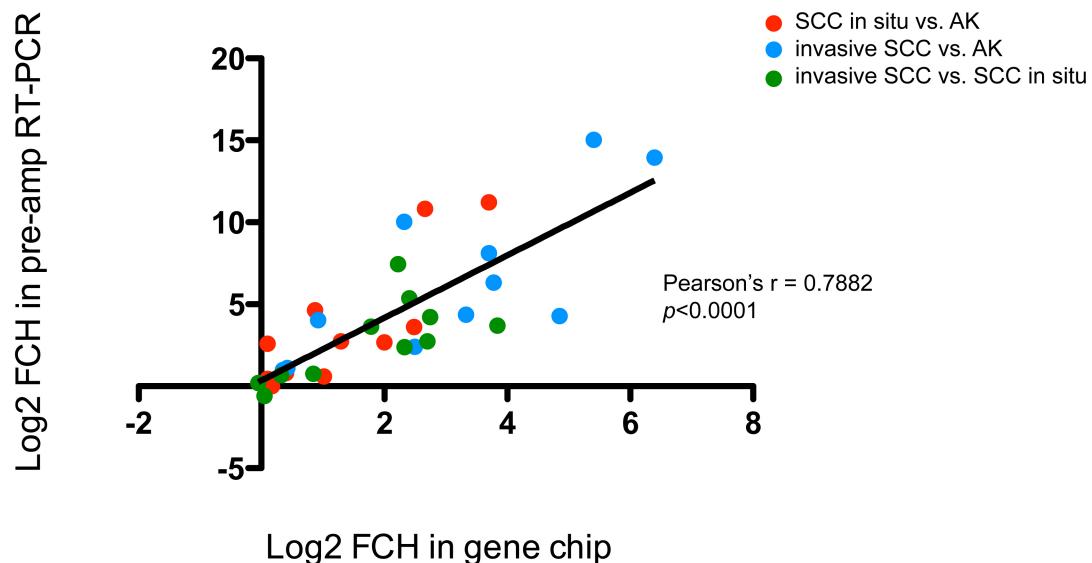

Figure S2. Correlation of FCH between genechip and pre-amp RT-PCR
 FCH in Log₂ obtained from cDNA microarray (x-axis) and pre-amplification RT-PCR (y-axis) was correlated as evidenced by Pearson's $r=0.7882$ ($p<0.0001$), when the 11 genes detected in both methods were compared [33 dots from three comparisons (AK vs. SCC in situ, invasive SCC vs. AK, and invasive SCC vs. SCC in situ) for 11 targets].

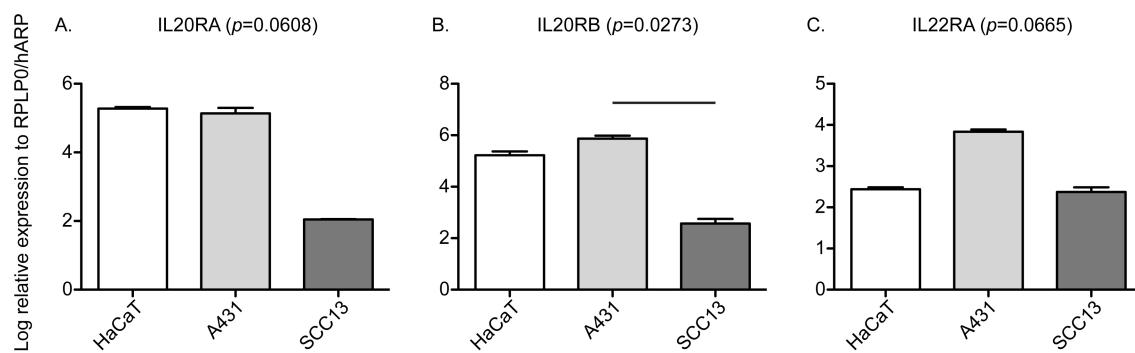

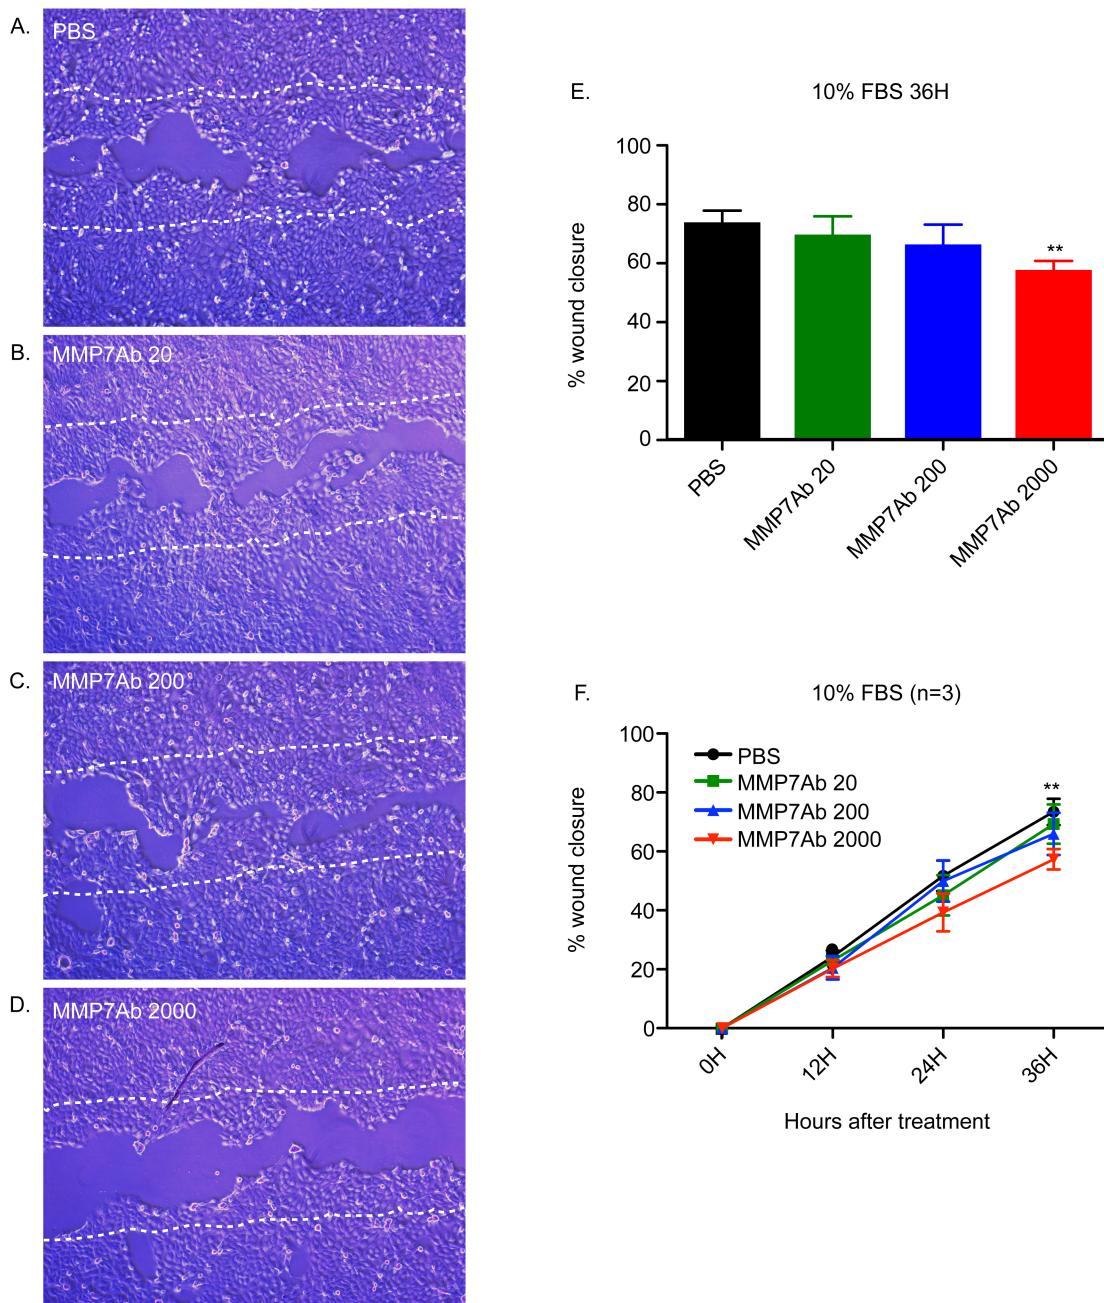

Figure S3.

Figure S3. *IL-24* receptor subunits expression in the three cell lines. mRNA expression of *IL-24* receptor subunits [(A) IL20RA, (B) IL20RB, and (C) IL22RA] were examined in the three cell lines (HaCaT, A431, and SCC13 cells). Total RNA was extracted from the cells treated with PBS for 4 hours. A p value for each receptor was obtained among the three cell types using repeated measures ANOVA with Tukey's correction. The resultant p values are shown in parentheses. A line between two bar indicates statistical significance between two cell types.

Figure S4.**Figure S4. Blocking of MMP7 delayed the wound closure of A431 cells.**

Scratch was made on A431 cells at 90% confluence and cells were cultured in 10%FBS containing media with or without indicated concentrations of anti MMP7 antibody (MMP7Ab) for 36 hours. Cells were photographed every 12 hours. (A-D) Representative images of wound after a 36 hour cultivation with (A) PBS, (B) 20ng/ml of MMP7Ab, (C) 200ng/ml of MMP7Ab, and (D) 2000ng/ml of MMP7Ab. Two white dotted lines depict the initial area of scratch. (E) The bar graph shows

mean of percent wound closure for each treatment after 36 hours. (F) The graph depicts the chronological change of the percent wound closure for each condition. An error bar shows SEM ($n=3$). **; $p<0.01$ between MMP7Ab2000 vs. PBS, MMP7Ab20, and MMP7Ab200 for a 36H treatment (repeated measures ANOVA with Tukey's correction).
