

Supplementary Figure 8

Supplementary Figure 8. Contrasting effects of VEGFR2 blockade on overall survival according to tumor histology. Kaplan-Meier survival curves of immunodeficient mice bearing UN-ADC12 tumorgrafts (A-B) and UN-SCC680 tumorgrafts (C-D) treated with sunitinib (A, C) or DC101 (B, D). The proportion of mice reaching experimental endpoint (accomplished when tumors reached 1.7 cm in diameter) over time is shown. P-values are those associated with the log-rank test; n=6 for all groups.
