

Supplementary Figure 1: SPM GLM results. (A) The imitative congruity effect ($p < 0.01$ voxels, cluster corrected $p < 0.05$); (B) main effect of cue type ($p < 0.001$, uncorrected) and (C) interaction contrasts ($p < 0.01$ voxels, cluster corrected $p < 0.05$) from the group GLM using SPM software. Neural systems are similar to those observed with FSL, but effects are not as robust.

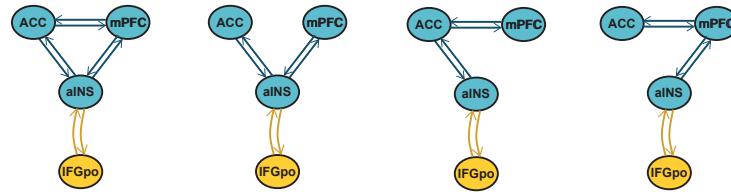

Supplementary Table 1: Local maxima from SPM-derived GLM.

Region	T	p-value (uncorrected)	p-value (cluster FWE)	MNI Coordinates

(A) Base models: 4 prefrontal connectivity structures.

(B) Connection & input variations (depicted on fully connected prefrontal structure). Dotted line depicts modulating input. Each model diagram represents 1 of 8 similar models (4 prefrontal connectivity structures shown in (A) x 2 structures with modulating input present or absent).

Supplementary Figure 2: DCM model space. (A) 4 prefrontal connectivity families were tested first to identify the most plausible structure. (B) The full model space was created by crossing 12 connectivity structures (3 prefrontal→MNS connections depicted in rows x 4 prefrontal structures shown in A), 4 potential targets for conflict as driving input (columns 1-4), and the presence or absence of conflict as a modulator of prefrontal→MNS connectivity (dotted lines). Inputs in all models are depicted in boxes (C=conflict; AO=action observation). The frontal node of the mirror neuron system is depicted in yellow (IFGpo=inferior frontal gyrus, pars opercularis) and prefrontal control network in blue (ACC=anterior cingulate; aINS=anterior insula; mPFC=medial prefrontal cortex).

Supplementary Table 2: Local maxima from significant clusters for imitative congruency effect (ImI – ImC).
