

SUPPORTING TABLES

Table S1. List of PCR primers used in this study.

Name	Primers sequences (5'-3')
Lmes_fwd	GATCGGATCCATGAGTTTTTTTAATAAAGG
Lmes_rev	GATCCTGCAGTTAAGCCTTGGTTTCTCCATAACC
KpneuF	GATCGGATCCATGAAGGTTGCGTTCAATAAAG
KpneuR	TGCACTGCAGCTATTCTTTCGATTTATACTC
AbaumF	GATCGGATCCATGAATATGTTACGTACAGG
AbaumR	TGCACTGCAGTTAGTCTTCTTTTTGTGCC
BanimF	GATCGGATCCATGGATGTGCTTTCCAAG
BanimR	TGCACTGCAGTTACGATTTACGATTTTTTC

Table S2. List of predicted BY-kinases in Bacteria

For each of predicted BY-kinase, columns represent: (1) GI, the GI number of BY-kinases; (2) Group, corresponding phylum/subphylum; (3) Loc, the localization of BY-kinase within chromosome (chr) or plasmid; (4) Organism, the name of corresponding organism; (5) Type, three BY-kinase types were defined: orphan CD (CD), CD with flanking TAD (TAD+CD), and TAD with CD encode by one gene (TAD-CD); (6) Order, corresponding order in taxonomy; (7) Family, corresponding family in taxonomy; (8) Genus, corresponding genus in taxonomy; (9) UGD, “+” means Ugd family proteins are present in corresponding organism; (10) PSN, corresponding subgroup in protein similarity network, “-“ means unclassified proteins; (11) Y-H, “+” means the Y-H pair is present in the kinase; (12) Y-R, “+” means the Y-R pair is present in the kinase; (13) YHR, “+” means both the Y-H and Y-R pairs are present in the kinase.

GI	Group	Location	Organism	Type	Order	Family	Genus	UGD	PSN	Y-H	Y-R	YHR

Table S3. Domain organization of BY-kinases in each bacterial phylum. Three types of BY-kinases domain organization were identified. TAD-AD, included the TAD-CD type kinases which containing both TAD and CD domain; TAD+CD, indicated CD type kinases which only containing CD domain, but neighbored with a protein harboring TAD domain; orphan CD, indicated CD type kinases without a corresponding protein with TAD domain. Column type, indicate the number of proteins corresponding to each type of domain organization with the corresponding number of genomes in brackets.

	Proteins (Genomes)		
	TAD-CD	TAD+CD	orphan CD
<i>Acidobacteria</i>	12(7)	1(1)	0
<i>Actinobacteria</i>	42(36)	1(1)	1(1)

C9	0	100	0	0	0	0

Table S9. Distribution of Ugd family proteins in prokaryotes. Ugd, the number of Ugd family proteins in corresponding phyla was shown and number in the bracket indicated corresponding organisms harboring the Ugd family proteins. BY-kinases, the number of BY-kinases in corresponding phyla was shown and number in the bracket indicated corresponding organisms harboring the BY-kinases. Ugd/BY-kinase, the number of genomes harboring both Ugd family proteins and BY-kinases.

	Ugd	BY-kinase	Ugd/BY-kinase
<i>Acidobacteria</i>	21(7)	13(7)	7
<i>Actinobacteria</i>	280(144)	44(37)	31
<i>Alphaproteobacteria</i>	235(140)	84(64)	64
<i>Aquificae</i>	16(9)	0	0
<i>Bacteroidetes/Chlorobi</i>	173(68)	28(24)	24
<i>Betaproteobacteria</i>	173(86)	103(42)	42
<i>Chlamydiae</i>	7(4)	0	0
<i>Chloroflexi</i>	18(9)	8(5)	5
<i>Crenarchaeota</i>	24(21)	0	0
<i>Cyanobacteria</i>	55(39)	19(7)	7
<i>Deinococcus-Thermus</i>	8(8)	2(2)	1
<i>Deltaproteobacteria</i>	113(43)	34(24)	24
<i>Epsilonproteobacteria</i>	31(19)	0	0
<i>Euryarchaeota</i>	142(70)	0	0
<i>Firmicutes</i>	390(202)	224(183)	126
<i>Fusobacteria</i>	3(2)	2(1)	1
<i>Gammaproteobacteria</i>	562(281)	209(165)	160
<i>Other Archaea</i>	4(2)	0	0
<i>Other Bacteria</i>	40(25)	13(7)	7
<i>Planctomycetes</i>	12(5)	8(4)	4
<i>Spirochaetes</i>	24(18)	2(2)	2
<i>Thermotogae</i>	15(13)	3(3)	3
Total	2346(1215)	796(577)	508

SUPPORTING FIGURES

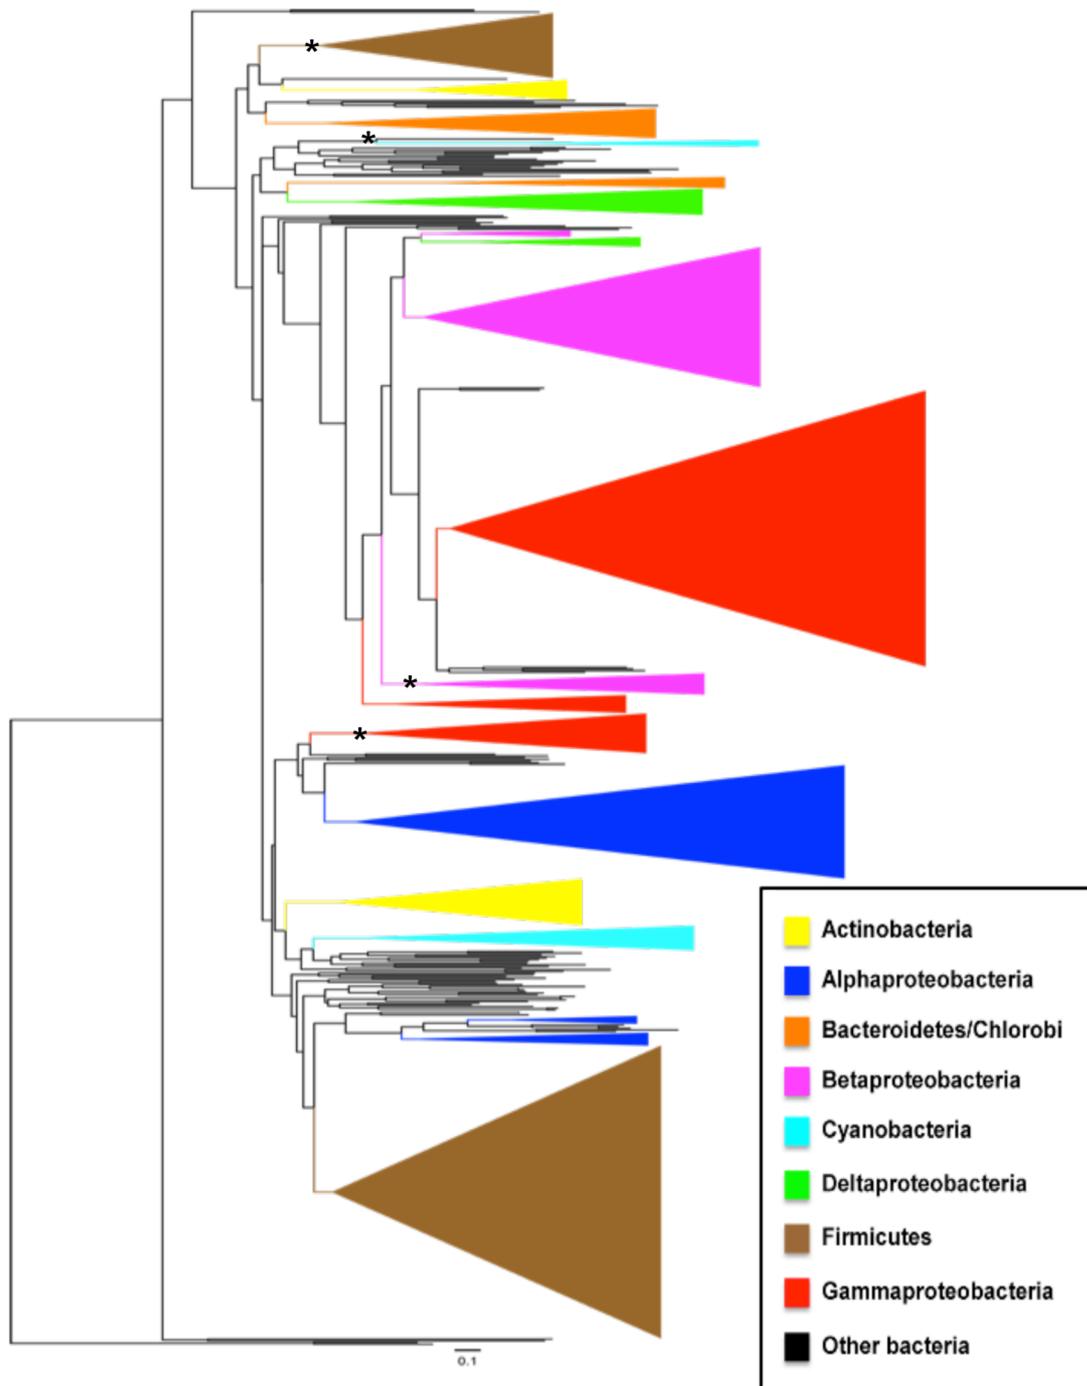

Figure S1. The phylogenetic tree of BY-kinases based on the CD domain from 796 sequences. The tree was rooted by using MinD proteins from *E. coli* (AAC74259) and from *B. subtilis* (CAB14759) as outgroups. The leaves are coloured according to taxonomic phylum. The branches with high bootstrap values (BV>0.5) are indicated with asterisk.

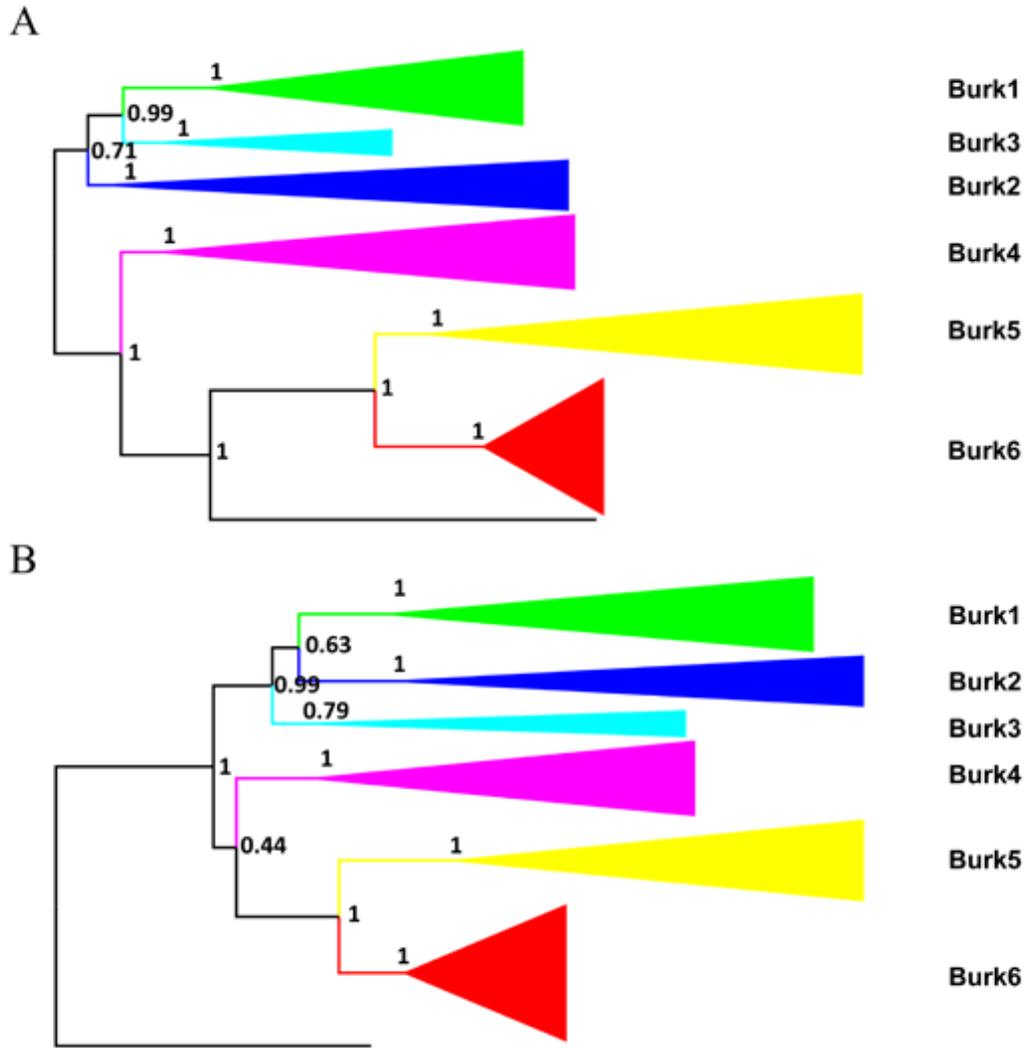

Figure S2. Phylogenetic analysis of BY-kinases in *Burkholderia*. The Bayesian trees were inferred from the BY-kinase full sequence (**A**) and CD (**B**). In both of trees, the *Burkholderia* BY-kinases form six distinct clades (Burk1-Burk6).

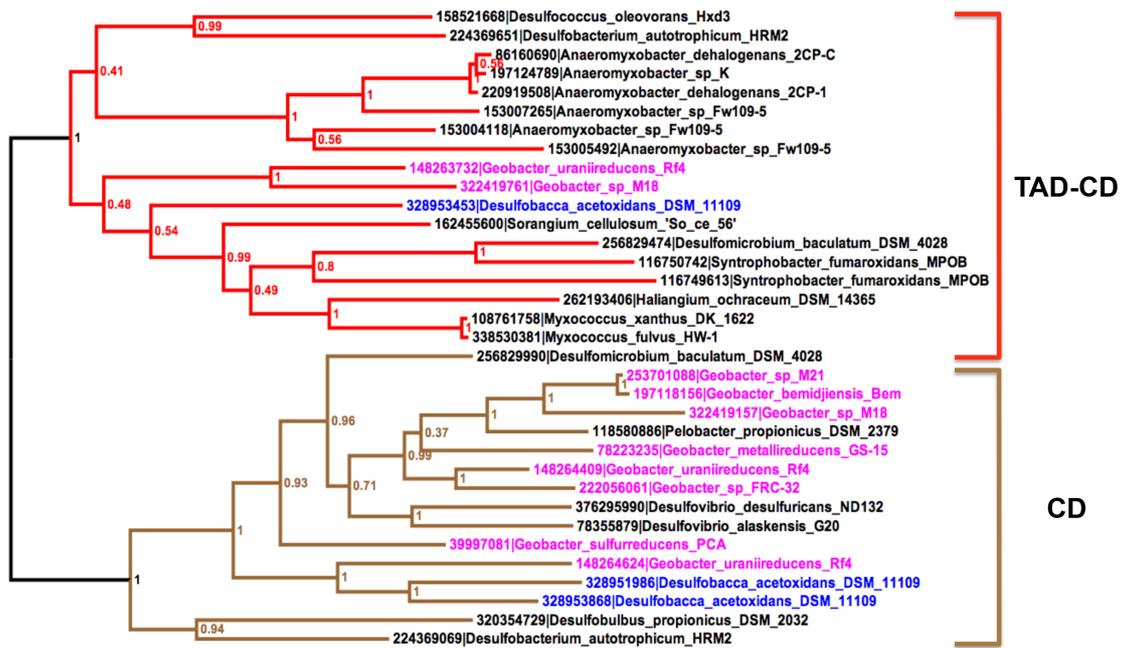

Figure S3. Phylogenetic analysis of BY-kinases in *Deltaproteobacteria*. The Bayesian trees were inferred from the BY-kinase CD sequences. The red branches indicated proteins with both TAD and CD, while the brown branches indicated the proteins only with CD. The BY-kinases from *Geobacter* and *Desulfobacca* genera are highlighted with colors.

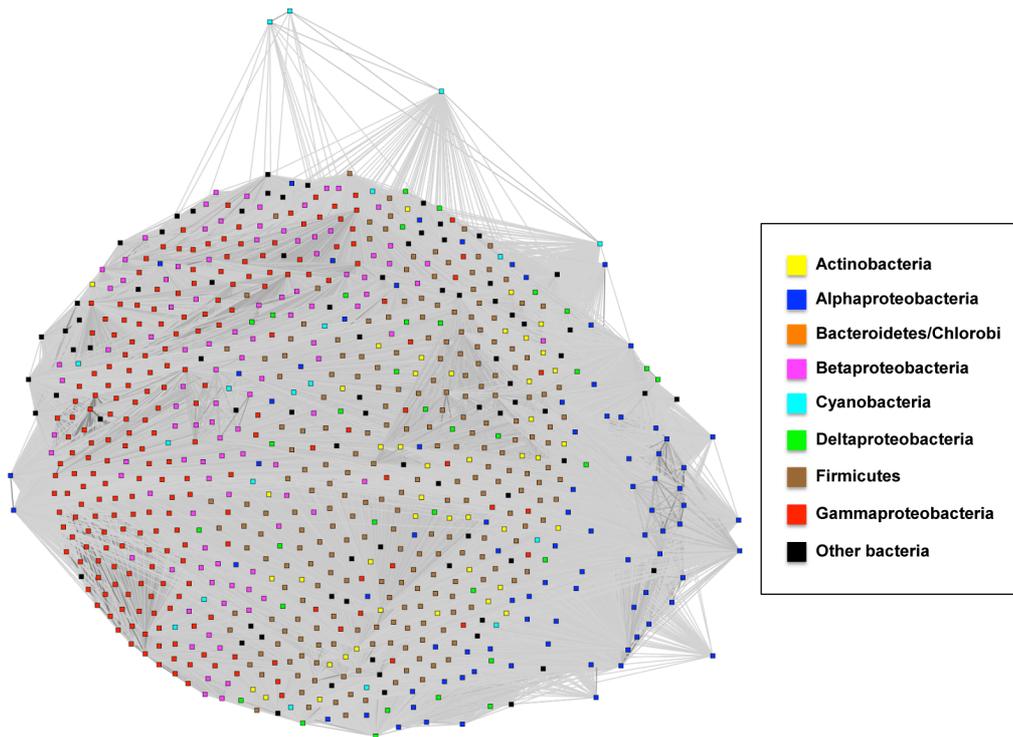

Figure S4A. The protein similarity network (PSN) reconstructed from the BY-kinases CD domain with an E-value cut-off of 10^{-20} . Nodes represent BY-kinases sequences, and the nodes from the same taxonomic groups are in the same color. The edges are colored with a gray scale, and the darker the color is, the more significant similarity is.

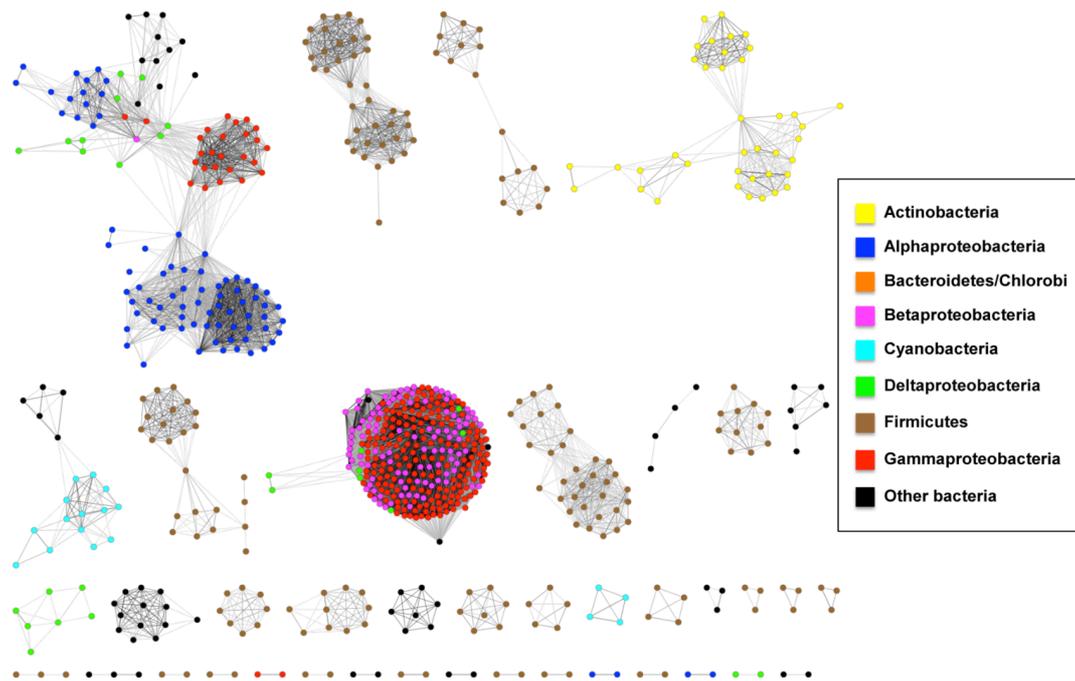

Figure S4B. The protein similarity network (PSN) reconstructed from the BY-kinases CD domain with an E-value cut-off of 10^{-100} . Nodes represent BY-kinases sequences, and the nodes from the same taxonomic groups are in the same color. The edges are colored with a gray scale, and the darker the color is, the more significant similarity is.

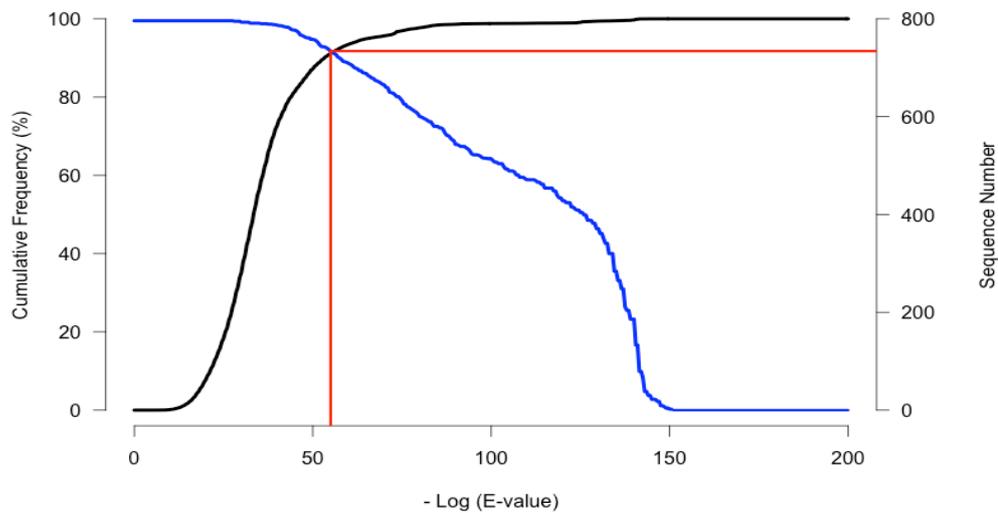

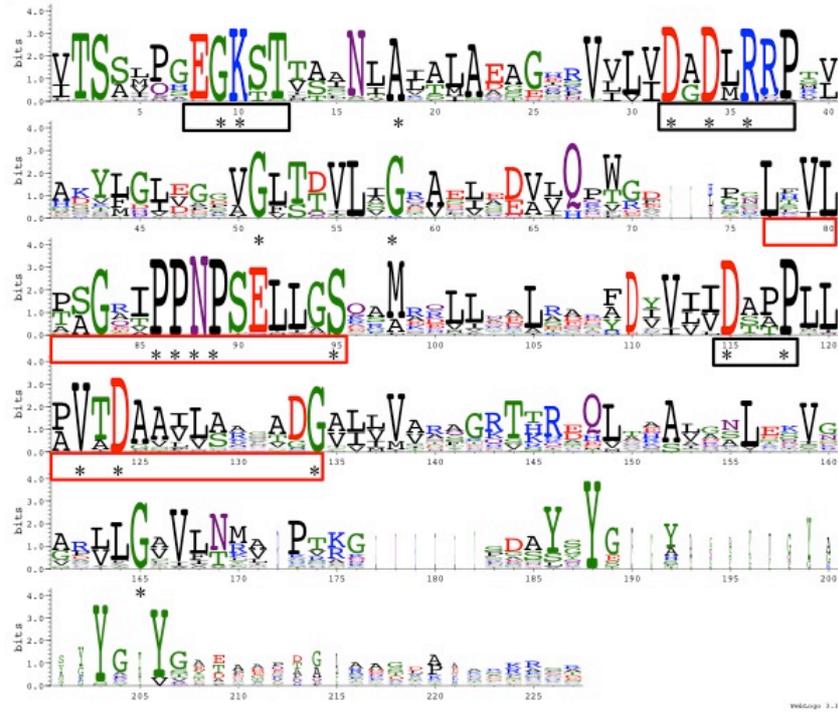

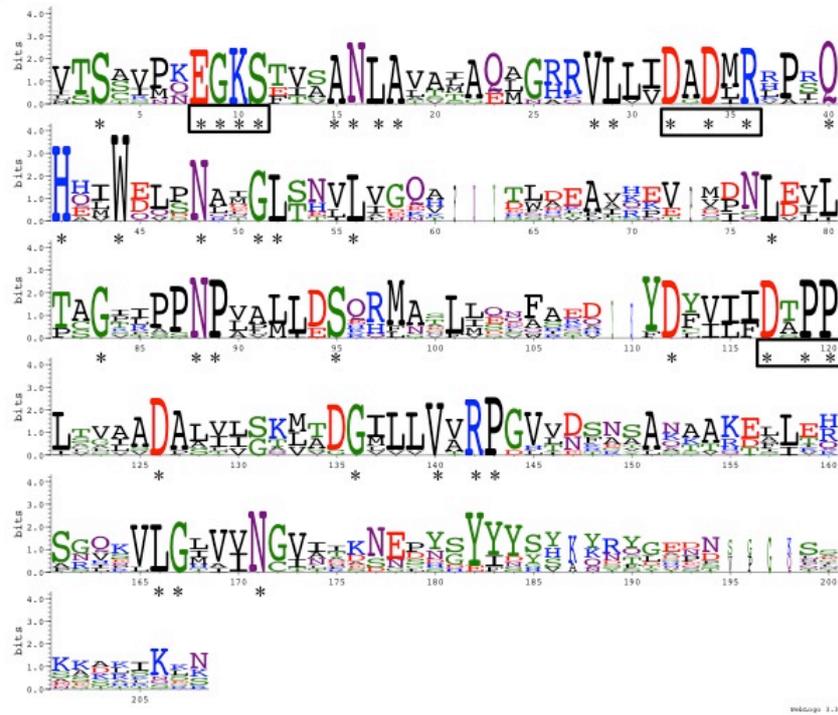

Figure S4C. The distribution of pairwise alignments E-values. The curve in black corresponds to the cumulative frequency of E-values from BY-kinase pairwise alignments (left Y axis). 8.8% of pairwise alignments have a E-value greater than 10^{-20} ($-\log(\text{E-value}) < 20$), 91.1% of pairwise alignments have a E-value greater than 10^{-55} ($-\log(\text{E-value}) < 55$), and 98.8% of alignments have a E-value greater than 10^{-100} ($-\log(\text{E-value}) < 100$). The blue curve indicates the number of sequences obtained after filtering with a given E-value (right Y axis). The optimal E-value (10^{-55}) corresponds to the cross-point of the two curves, leading to 736 (over 796) sequences for further analysis.

Figure S5. Sequence logos of the BY-kinase subgroups. The sequence logos were constructed from the multiple alignment of each subgroup (A1 – C9). The number of sequences within each subgroup is indicated in parentheses. Asterisk indicated the strong conserved site (100% identity) in the alignment. Black frame indicated the conserved A, A', and B motifs, while red frames indicated the ten most significant signature motifs in subgroups have more than 20 sequences.

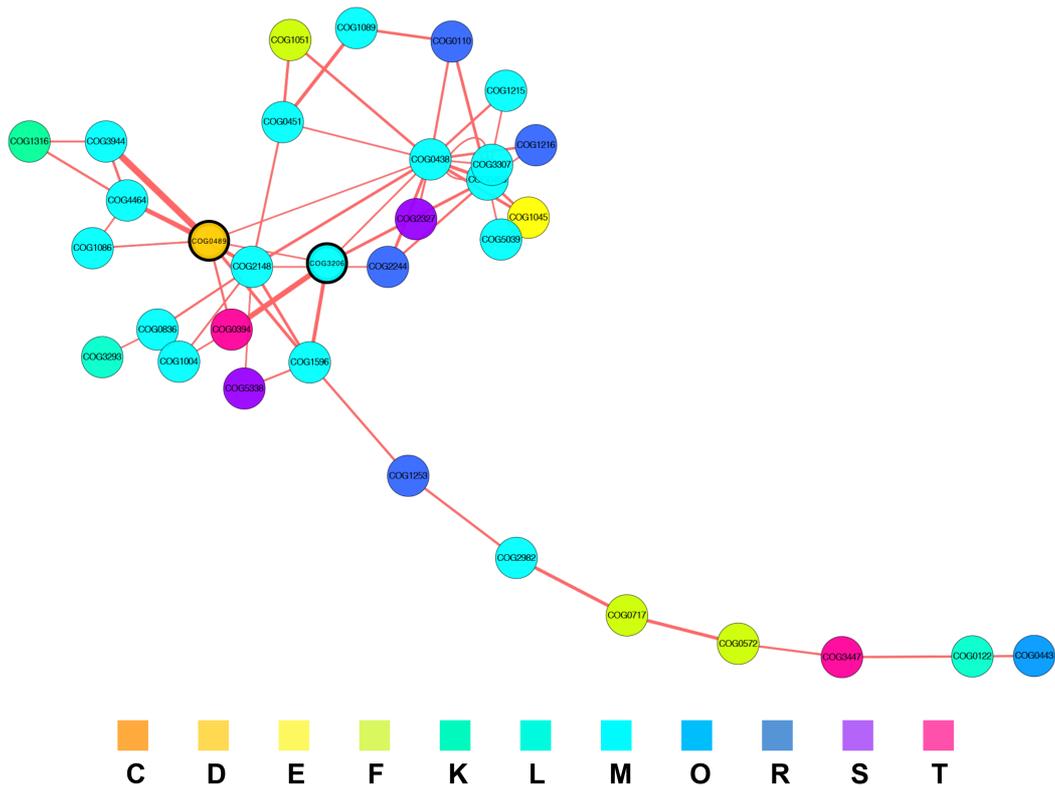

Figure S6. Functional module relationships of BY-kinases in a genomic-context network. The BY-kinases are classified into COG0489 or COG3206. A high number of edges linking to BY-kinases are classified into COG class M, which involved in cell wall/membrane/envelop biogenesis. In particular, COG0394 (Protein-tyrosine-phosphatase) is linked to BY-kinase in some genomes. Nodes are colored in function of the COG classes, and the width of links corresponds to strength of co-occurrences.

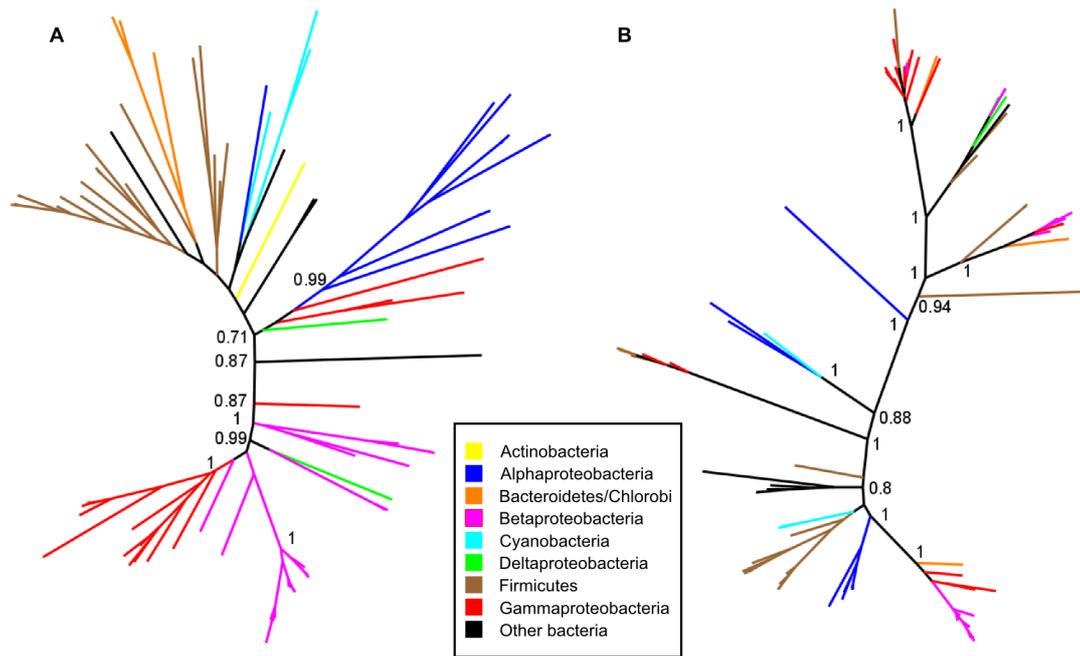

Figure S7. Phylogenetic analysis of BY-kinase and Ugd pairs. (A) The unrooted tree of BY-kinases. (B) The unrooted tree of paired Ugd proteins. Numbers indicate corresponding posterior probability.
