

Supplementary information, Figure S2 DI^+ cells and $Su(H)\text{-lacZ}^+$ cells in the CCR are lineage-related. A GFP clone (in green) generated by the MARCM system contains one DI^+ (in red, arrow) cell and one $Su(H)\text{-lacZ}^+$ (in white, arrowhead) cell. DAPI staining is in blue. The common origin of these two cells indicates that they are lineage-related.
