Supplementary Figure 1:

Concentration of IL-6 in serum from multiple myeloma model surviving mice. Shown are measurements performed in triplicate by ELISA and representative of 3 independent assays performed in triplicate or duplicate.

Supplementary Figure 2:

Peritoneal infiltration of neutrophils in mice after administration of PBS, Anakinra 30 mg/kg, or P2D7KK 15 mg/kg followed 18 hours later by injection of monosodium urate crystals (MSU). Shown are mean \pm sem on 1 experiment with 8 mice per group. Data analysed by ANOVA followed by a multiple test with Bonferroni's correction: n.s. not significant, *** $p < 0.001$, **** $p < 0.0001$.

Neutrophils number (x10³)
