

**Supplementary Figure 13. Level of IL-27 in lung homogenates or plasma of mice after late IL-27 treatment.** C57BL/6 mice were challenged influenza virus then treated daily with rIL-27 from 5-9 d.p.i. At 9 d.p.i, homogenates of lung tissues were obtained by mashing the lungs (approximately 200 mg) with 10 mL of medium. Levels of IL-27 in the lung homogenates or plasma were determined by ELISA.
