

Supplementary tables

	Table of Contents
2	Table S0: Statistics of Illumina HiSeq2000 sequencing output data for <i>B. licheniformis</i> strains
3	G-1, F1-1 and F2-1 3
4	
5	Table S1: Comparison of genes among strains G-1, F1-1 and F2-1 as determined by RAST,
6	TBLASTN and raw read mapping. 4
7	
8	Table S2A: The ‘Mobility and chemotaxis’ genes in <i>B. subtilis</i> 168 and the regions of their
9	homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1..... 11
10	
11	Table S2B: The ‘Mobility and chemotaxis’ genes in <i>B. licheniformis</i> ATCC 14580 and the
12	regions of their homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1 ¹ 18
13	
14	Table S3A: The genes involved in the protein secretion in <i>B. subtilis</i> 168 and the regions of
15	their homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1 20
16	
17	Table S3B: The genes involved in the protein secretion in <i>B. licheniformis</i> ATCC 14580 and
18	the regions of their homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1 ¹ 23
19	
20	Table S4: The genes involved in the metabolism of phosphate in <i>B. subtilis</i> 168 and the
21	regions of their homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1 25
22	
23	Table S5: The genes involved in the metabolism of sulphur in <i>B. subtilis</i> 168 and the regions
24	of their homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1 27
25	
26	Table S6A: The genes involved in transformation/ competence in <i>B. subtilis</i> 168 and the
27	regions of their homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1 29
28	
29	Table S6B: The genes involved in transformation/ competence in <i>B. licheniformis</i> ATCC
30	14580 and the regions of their homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1 ¹ 32
31	
32	Table S7A: The genes involved in the sporulation in <i>B. subtilis</i> 168 and the regions of their
33	homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1..... 33
34	
35	Table S7B: The genes involved in the sporulation in <i>B. licheniformis</i> ATCC 14580 and the
36	regions of their homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1 ¹ 49
37	
38	Table S8A: The genes involved in germination in <i>B. subtilis</i> 168 and the regions of their
39	homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1..... 55
40	
41	Table S8B: The genes in <i>B. licheniformis</i> ATCC 14580 and the regions of their homologs in
42	<i>B. licheniformis</i> strains G-1, F1-1, and F2-1 ¹ 60
43	
44	Table S9: Homology search results for biofilm related genes in <i>Bacillus licheniformis</i> strains
45	G-1, F2-1, and F1-1 ¹ 61
46	
47	Table S10A: The genes involved in adaptation to atypical conditions in <i>B. subtilis</i> 168 and
48	the regions of their homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1 64

35	Table S10B: The genes involved in adaptation to atypical conditions in <i>B. licheniformis</i>	
36	ATCC 14580 and the regions of their homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-	
37	11.....	73
38	Table S11A. The genes involved in antibiotic production in <i>B. subtilis</i> 168 and the regions of	
39	their homologs in <i>B. licheniformis</i> strains G-1, F2-1, and F1-1	75
40	Table S11B. The genes involved in antibiotic production in <i>B. licheniformis</i> ATCC 14580	
41	and the regions of their homologs in <i>B. licheniformis</i> strains G-1, F2-1, and F1-1 ¹	79
42	Table S12A: The genes involved in detoxification in <i>B. subtilis</i> 168 and the regions of their	
43	homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1.....	81
44	Table S12B: The genes involved in detoxification in <i>B. licheniformis</i> ATCC 14580 and the	
45	regions of their homologs in <i>B. licheniformis</i> strains G-1, F1-1, and F2-1 ¹	92
46	Table S13: Selected genes involved in metabolism of carbohydrate and related molecules in	
47	<i>B. subtilis</i> 168 and the regions of their homologs in <i>B. licheniformis</i> strains G-1, F1-1, and	
48	F2-1	94
49	Table S14: Contigs, coordinates, and completeness of phage or related regions in strains G-1,	
50	F2-1, and F1-1 ¹	98

Putative peptidoglycan hydrolase (YvbX)	Y	12 (154529-155560)	N	-	N	-	N	Y	<i>B. atrophaeus</i> 1942 (YP_003974852.1)
Spore germination protein (GerHB/GerIB)	Y	32 (203381-204496)	N	-	N	-	N	N	<i>B. licheniformis</i> WX-02 (ZP_17656399.1)
Nickel transporter (UreH)	Y	31 (413565-414254)	N	-	N	-	N	N	<i>Bacillus</i> sp. 10403023 (ZP_10915662.1)
Biphenyl-2,3-diol 1,2-dioxygenase III-related protein	Y	15 (638813-639202)	Y	Raw reads	Y	Raw reads	Y	N	<i>Rhizobium etli</i> IE4771 (ZP_03515769.1)
Deoxyuridine 5'-triphosphate nucleotidohydrolase	Y	30 (30553-31095)	N	-	N	-	N	N	<i>B. sonorensis</i> L12 (ZP_22898133.1)

Potassium-transporting ATPase A chain	Y	30 (418208-419878)	N	-	N	-	N	N	<i>B. sonorensis</i> L12 (ZP_22899191.1)
Potassium-transporting ATPase B chain	Y	30 (419895-421964)	N	-	N	-	N	N	<i>B. sonorensis</i> L12 (ZP_22899190.1)
Potassium-transporting ATPase C chain	Y	30 (421980-422537)	N	-	N	-	N	N	<i>B. sonorensis</i> L12 (ZP_22899189.1)
Alanyl-tRNA synthetase family protein	Y	30 (498547-499785)	Y	1 (1099683 to 1100912)	N	-	Y	N	<i>B. licheniformis</i> ATCC 14580 (YP_079922.1)
Urease accessory protein UreD	Y	31 (412669-413490)	N	-	N	-	N	N	<i>Bacillus</i> sp. 10403023 (ZP_10915663.1)
Urease accessory protein UreE	Y	31 (410904-411356)	N	-	N	-	N	N	<i>Bacillus</i> sp. 10403023 (ZP_10915666.1)
Urease accessory protein UreF	Y	31 (411352-412032)	N	-	N	-	N	N	<i>Bacillus</i> sp. 10403023 (ZP_10915665.1)
Urease accessory protein UreG	Y	31 (412107-412664)	N	-	N	-	N	N	<i>Bacillus</i> sp. 10403023 (ZP_10915664.1)
Urease subunit alpha	Y	31 (409181-	N	-	N	-	N	Y	<i>Bacillus</i> sp. 10403023 (ZP_10915667.1)

		<i>410890)</i>							
Urease subunit beta	Y	<i>31 (408858-409181)</i>	N	-	N	-	N	N	<i>Bacillus</i> sp. 10403023 (ZP_10915668.1)
Urease subunit gamma	Y	<i>31 (408567-408833)</i>	N	-	N	-	N	N	<i>Paenibacillus alvei</i> DSM 29 (ZP_10862792.1)
Xylose ABC transporter, periplasmic xylose- binding protein (XylF)	N	-	Y	<i>4 (152214-153275)</i>	Y	<i>2 (152189-153250)</i>	Y	N	<i>Bacillus</i> sp. BT1B_CT2 (ZP_08003205.1)
Cell-division initiation protein	Y	Raw reads	Y	<i>14 (34320-34694)</i>	Y	<i>4 (21007-21381)</i>	Y	Y	<i>B. licheniformis</i> ATCC 14580 (YP_077348.1)
Recombinational DNA repair protein RecT (prophage associated)	Y	Raw reads	Y	Raw reads	Y	<i>1 (137935-138666)</i>	Y	Y	<i>Bacillus vallismortis</i> DV1-F-3 (ZP_10509695.1)
Competence protein F homolog, phosphoribosyltransf erase domain	Y	Raw reads	Y	<i>25 (178363-179094)</i>	Y	<i>24 (33244-34152)</i>	Y	Y	<i>B. licheniformis</i> ATCC 14580 (YP_080871.1)

69 ¹Y=Presence of gene, N=Absence of gene or only a few reads (1-6) were aligned with the coverage depth of 1 when raw reads corresponding to the gene were
70 mapped to the contigs of another strain having this gene in order to see its presence or absence.¹Raw reads with significant coverage were seen in the strain
71 when the former were mapped to the contigs of another strain.

72

73 **Table S2A: The ‘Mobility and chemotaxis’ genes in *B. subtilis* 168 and the regions of
74 their homologs in *B. licheniformis* strains G-1, F1-1, and F2-1**

B. <i>subtilis</i> gene ¹	Contigs and coordinates in strains of <i>B. licheniformis</i> where the homologous sequence is found					
	G-1		F1-1		F2-1

75 ¹Homology for the proteins encoded by these genes were first searched with TBLASTN
76 using BLOSUM62 matrix in the three target strains, and if the region of significant homology
77 was not achieved using this matrix, BLOSUM45 matrix was used. If the protein sequences
78 did not show homology, discontiguous megablast with corresponding nucleotide sequences
79 as queries (instead of amino acid sequenced) were used (homologous regions found in such a
80 way are shown green). ²NSH means ‘no significant homology’. The contigs and coordinates
81 for the genes for which query coverage was 95% or less are coloured brown. The percentage
82 identity in black and brown fonts represents amino acid identity and that in green represents
83 nucleotide identity.

138 ¹If no homologous region is found for any amino acid sequence or gene by using the
 139 sequence from *B. subtilis*, the corresponding amino acid or gene sequence was obtained from

140 *B. licheniformis* ATCC 14580 (NC_006322.1). ²These genes, when extracted from *B.*
141 *subtilis* genome, had shown no significant homology in table S3A. The way of performing
142 homology search and colour codes are same as that used in table S3A. Additionally, if the
143 protein sequences did not show homology, discontiguous megablast with corresponding
144 nucleotide sequences as queries (instead of amino acid sequences) were used (homologous
145 regions found in such a way are shown green). The percentage identity in black font
146 represents amino acid identity and that in green represents nucleotide identity. ³NSH means
147 either ‘no significant homology’ or a few reads (1-6) with the coverage depth of 1 could be
148 aligned when the raw reads from the strain were mapped onto the genome of another strain in
149 which the related gene is present.

201 ¹Homology for the proteins encoded by these genes were first searched with TBLASTN
 202 using BLOSUM62 matrix in the contigs of three target strains, and if the region of significant
 203 homology was not achieved using this matrix, BLOSUM45 matrix was used. ²NSH means
 204 ‘no significant homology’. ³This is a gene of small size and hence the score below 50 was
 205 used to determine its presence. The genes for which query coverage was 95% or less are
 206 coloured brown. The percentage identity represents amino acid identity.

219 ¹If no homologous region is found for any amino acid sequence or gene by using the
220 sequence from *B. subtilis*, the corresponding amino acid or gene sequence was obtained from
221 *B. licheniformis* ATCC 14580 (NC_006322.1) and homology search was performed similar
222 to those for the genes in table S6A. ²These genes, when extracted from *B. subtilis* genome,
223 showed no significant homology in table S6A.

224 **Table S7A: The genes involved in the sporulation in *B. subtilis* 168 and the regions of
225 their homologs in *B. licheniformis* strains G-1, F1-1, and F2-1**

<i>B. subtilis</i> gene ¹	Contig, coordinates and % identity in strains of <i>B. licheniformis</i> where the homologous sequence is found

226 ¹Homology for the proteins encoded by these genes were first searched with TBLASTN
 227 using BLOSUM62 matrix in the contigs of three target strains, and if the region of significant
 228 homology was not achieved using this matrix, BLOSUM45 was used. If the protein
 229 sequences did not show homology using this approach, discontiguous megablast with
 230 corresponding gene sequences as queries were used (homologous regions found in such a
 231 way are shown green). ²NSH means ‘no significant homology’. The contigs and coordinates
 232 of the genes for which query coverage was 95% or less are coloured brown. The percentage
 233 identity in black and brown fonts represents amino acid identity and that in the green
 234 represents nucleotide identity.

245 ¹If no homologous region is found for any amino acid sequence or gene by using the
 246 sequence from *B. subtilis*, the corresponding amino acid or gene sequence was obtained from
 247 *B. licheniformis* ATCC 14580 (NC_006322.1). The colour codes are same as that used in the
 248 above table. ²These genes, when extracted from *B. subtilis* genome, showed no significant
 249 homology in table S7A. Rows with ‘-’ in all boxes means genes were not found in *B.*
 250 *licheniformis* ATCC 14580 (NC_006322.1) for further comparison with strains G-1, F1-1,
 251 and F2-1. ³NSH means either no significant homology or a few raw reads (1-6) were mapped
 252 with the coverage depth of 1 with the genomic region of another strain possessing this gene.
 253 ⁴Raw reads from the strain were aligned to the gene of another strain with significant coverage
 254 depth.

266 ¹Homology for the proteins encoded by these genes were first searched with TBLASTN
 267 using BLOSUM62 matrix in the contigs of three target strains, and if the region of significant
 268 homology be not achieved using this matrix, BLOSUM45 matrix was used. If the protein
 269 sequences did not show homology, discontiguous megablast with corresponding gene
 270 sequences as queries were used (homologous regions found in such a way are shown green).
 271 ²NSH means ‘no significant homology’. The contigs and coordinates of genes for which
 272 query coverage was 95% or less are coloured brown. The percentage identity in black and
 273 brown fonts represents amino acid identity and that in the green represents nucleotide
 274 identity.

318 ¹Homology for the proteins encoded by these genes were first searched with TBLASTN
319 using BLOSUM62 matrix in the contigs of three target strains, and if the region of significant
320 homology was not achieved using this matrix, BLOSUM45 matrix was used. If the protein
321 sequences did not show homology, discontiguous megablast with corresponding gene
322 sequences as queries were used (homologous regions found in such a way are shown green).

323 ²NSH means ‘no significant homology’. The contigs and coordinates of genes for which
324 query coverage was 95% or less are coloured brown. The percentage identity in normal black
325 and brown fonts represents amino acid identity and that in green represents nucleotide
326 identity. ³The gene was observed in strains F1-1 and F2-1 only after mapping their raw reads
327 with assembled contigs of strain G-1.

341 ¹If no homologous region is found for any amino acid sequence or gene by using the
 342 sequence from *B. subtilis*, the corresponding amino acid or gene sequence was obtained from
 343 *B. licheniformis* ATCC 14580 (NC_006322.1). The method of homology search and colour
 344 codes is same as that used in the above table. ²These genes, when extracted from *B. subtilis*
 345 genome, showed no significant homology in table S10A. ³NSH means ‘no significant
 346 homology’. Rows with ‘-’ in all boxes means genes were not found in *B. licheniformis* ATCC
 347 14580 (NC_006322.1) for further comparison with strains G-1, F1-1, and F2-1.

358 ¹Homology for the proteins encoded by these genes were first searched with TBLASTN
 359 using BLOSUM62 matrix in the contigs of three target strains, and if the region of significant
 360 homology was not achieved using this matrix, BLOSUM45 matrix was used. If the protein
 361 sequences did not show homology, discontiguous megablast with corresponding gene
 362 sequences as queries were used (homologous regions found in such a way are shown green).
 363 ²NSH means ‘no significant homology’. The contigs and coordinates of genes for which
 364 query coverage was 95% or less are coloured brown. The percentage identity represents
 365 amino acid identity. ^{3, 4}For *pps* and some *srf* genes, only the contig numbers are recorded in
 366 the table for clarity because they had too many matches, which might have been partial and
 367 overlapping, partial and non-overlapping or full length non-overlapping.

377 ¹If no homologous region is found for any amino acid sequence or gene by using the
 378 sequence from *B. subtilis*, the corresponding amino acid or gene sequence was obtained from
 379 *B. licheniformis* ATCC 14580 (NC_006322.1). The colour codes are same as that used in the
 380 above table. ²These genes, when extracted from *B. subtilis* genome, showed no significant
 381 homology in table S11A. Rows with ‘-’ in all boxes means genes were not found in *B.*
 382 *licheniformis* ATCC 14580 (NC_006322.1) for further comparison with strains G-1, F1-1,
 383 and F2-1.

384 **Table S12A: The genes involved in detoxification in *B. subtilis* 168 and the regions of**
 385 **their homologs in *B. licheniformis* strains G-1, F1-1, and F2-1**

386 Homology for the proteins encoded by these genes were first searched with TBLASTN
 387 using BLOSUM62 matrix in the contigs of three target strains, and if the region of significant
 388 homology was not achieved using this matrix, BLOSUM45 matrix was used. If the protein
 389 sequences did not show homology, discontiguous megablast with corresponding gene

390 sequences as queries were used (homologous regions found in such a way are shown green).

391 ²NSH means ‘no significant homology’ or few (1-6) reads was aligned with the depth of

392 coverage 1 when the raw reads from the strain were mapped with the genomic region of

393 another strain containing the gene. The contigs and coordinates of genes for which query

394 coverage was 95% or less are coloured brown. The percentage identity in black and brown

395 fonts represents amino acid identity and that in the green represents nucleotide identity. ³Raw

396 reads were mapped to the genomic region of another strain.

412 ¹If no homologous region is found for any amino acid sequence or gene by using the
 413 sequence from *B. subtilis*, the corresponding amino acid or gene sequence was obtained from

414 *B. licheniformis* ATCC 14580 (NC_006322.1). The method of homology search and colour
415 codes is same as that used in table S12A. These genes, when extracted from *B. subtilis*
416 genome, showed no significant homology in table S12A. Rows with ‘-’ in all boxes means
417 genes were not found in *B. licheniformis* ATCC 14580 (NC_006322.1) for further
418 comparison with strains G-1, F1-1, and F2-1.
