

Additional File 6: SA contents in Bur, Ler and NILs

Additional File 6 provides evidence that SA hyperinduction, which is characteristic for Bur, is not associated with the *vec1*-locus.

SA-content of Bur, Ler and two near-isogenic lines: NIL9 (*Ler*-alleles in the variable region) and NIL5 (*Bur*-alleles). Differences between mock- and *V. longisporum*-inoculated plants were significant ($n = 6-7$, $p < 0.05$). Means of plants marked with different letters **within one treatment** (mock- and *V. longisporum*-inoculated, respectively) differed significantly at $p < 0.05$. (one-way ANOVA and post-hoc Tukey test). Vertical bars denote standard deviations.
