

## Additional File 7: Phytohormone contents of *erecta* mutants, corresponding WT-lines and Bur

Additional File 7 provides evidence that differences in phytohormone response to *V. longisporum* between Bur and Ler are not caused by *Erecta*.

Contents of the phytohormones a) SA, b) ABA and c) JA in *erecta* mutants and their corresponding WT-lines, and Bur upon infection. Asterisks refer to the significance level of differences between mock-inoculated and *V. longisporum*-treated plants **within one genotype** (t-test, n = 6). **Within one treatment**, genotype means were compared by one-way ANOVA and multiple comparisons (Tukey test). Means marked with different letters differed significantly at  $p < 0.05$ . Vertical bars denote standard deviations.
