

Table S1. Sensitivity analysis: model fitting results based on "shifted" ROM outputs, with the rate of shifting $a = 0\%$ to 20% , with increments 5% . Since the age patterns estimated from the shifted data are identical to that based on the original data, we only report the nonzero parameter estimates.

Pre-1990 Period					
	Original	5%	10%	15%	20%
m_1	1.650	1.617	1.610	1.624	1.617
