

SUPPLEMENTARY FIG. S2. Expression of cardiac genes hDE-MSCs after standard myogenic-differentiation medium. PMSCs (two donors), hFOB, and hE-MSCs were cultured in MM1 (medium with 2% horse serum) or MM2 (MM1 with 5 μ M of 5-azacytadine) for 3–7 days and assayed for expression of the cardiac genes *connexin 43* and troponin T (*TNT*). C, control/expansion medium. The human rhabdomyosarcoma cell line RD was used as a positive control.
