

INF response
2 week post-treatment

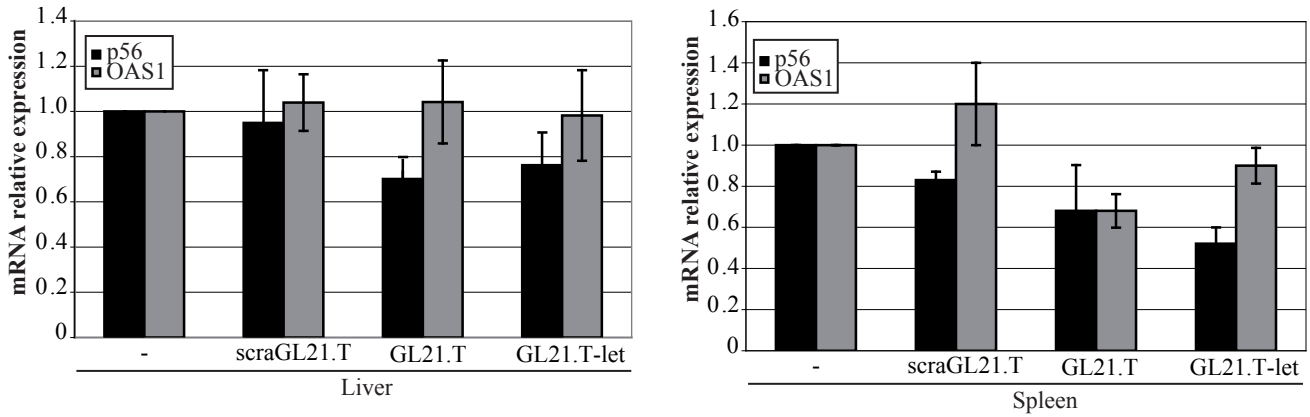

Figure S5. Immune response analyses 2-week post-treatment. At end of tumor growth experiment, animals were sacrificed, liver (*left*) and spleen (*right*) were recovered, lysed for RNA extraction and pooled. PBS-treated mice were used as a negative control. P56 and OAS1 mRNAs were analysed and values expressed as relative to control arbitrarily set to 1. Error bars depict means \pm S.D..
