**Figure S1. Expression of HOXC8 and CDH11 in control, HOXC8-knockdown cells and knockdown cells with ectopic CDH11 expression.** Overnight culture cells were lysed for Western blot to detect HOXC8, CDH11 and  $\beta$ -actin with the respective antibodies.

**Figure S2. *In vivo* tumor outgrowth of mice receiving control MDA-MB-231 cells, MDA-MB-231 cells lentivirally transduced with HOXC8 shRNA or HOXC8 shRNA plus CDH11 expression vector.** Cells ( $10^6$  cells/mouse) were subcutaneously injected at 4th mammary fat pad area of female athymic nude mice (4-6 weeks of age). Xenografts were externally measured in two dimensions using a caliper. Data are means  $\pm$  sem. n=10. Student-Newman-Keuls test were used to compare three groups. Conclusion: there was no statistically significant difference among control, HOXC8 KD and HOXC8 KD + CDH11 groups.
