Supplementary Figures

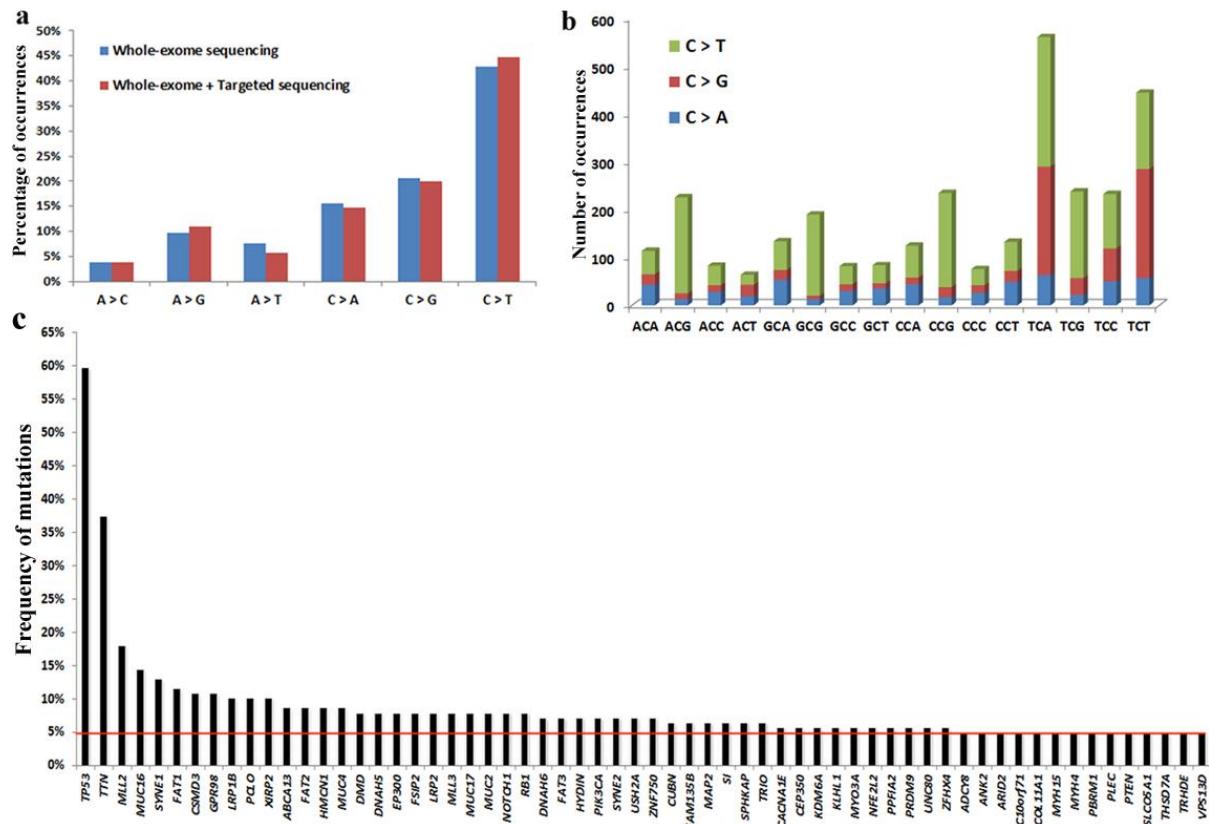

Supplementary Figure 1. Somatic mutation frequencies detected in exomes from ESCC and other human cancers.

Each dot represents an examined case (tumor-germline pair), and tumor types are ordered by their median somatic mutation frequencies (indicated by the black dash line). The number beneath X-axis indicates the number of examined cases of each cancer. Except ESCC, all of the other cancers were sequenced and published elsewhere, and their data were re-analyzed by Lawrence *et al*¹. CLL, chronic lymphocytic leukemia; MM, multiple myeloma; GBM, glioblastoma multiforme; DLBCL, diffuse large B-cell lymphoma; HNSCC, head and neck squamous cell carcinoma; EAC, esophageal adenocarcinoma; Lung AC, lung adenocarcinoma; Lung SCC, lung squamous cell carcinoma.

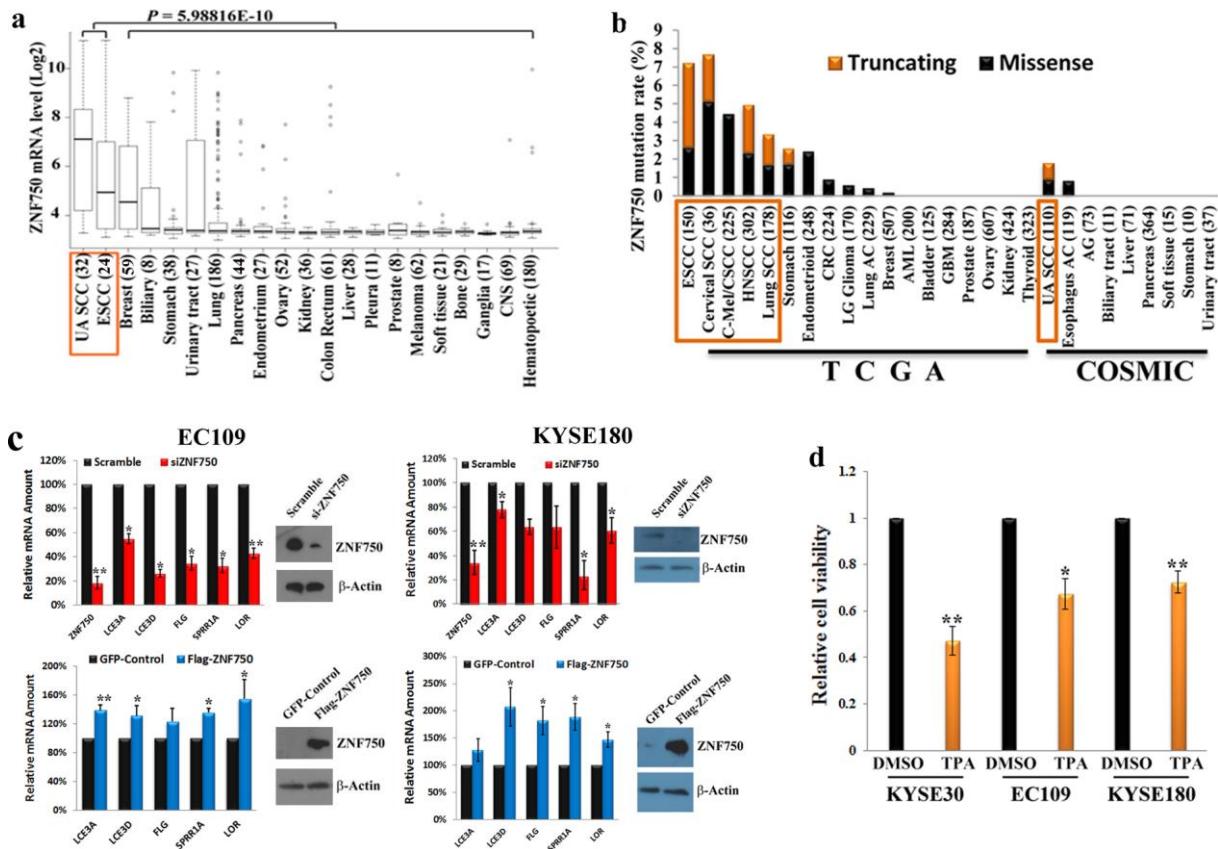

Supplementary Figure 2. Intratumoral clonality analysis.

Intratumoral clonality plots of four representative ESCC cases from Discovery Cohort. ESCC-D13, D15, D17 tumors were developed bi-clonal whereas ESCC-D14 tumor showed multi-clonal structure. Variant allele frequency was calculated with copy-number neutral variants, which was further used to plot intratumoral clonal architectures²⁻⁵.

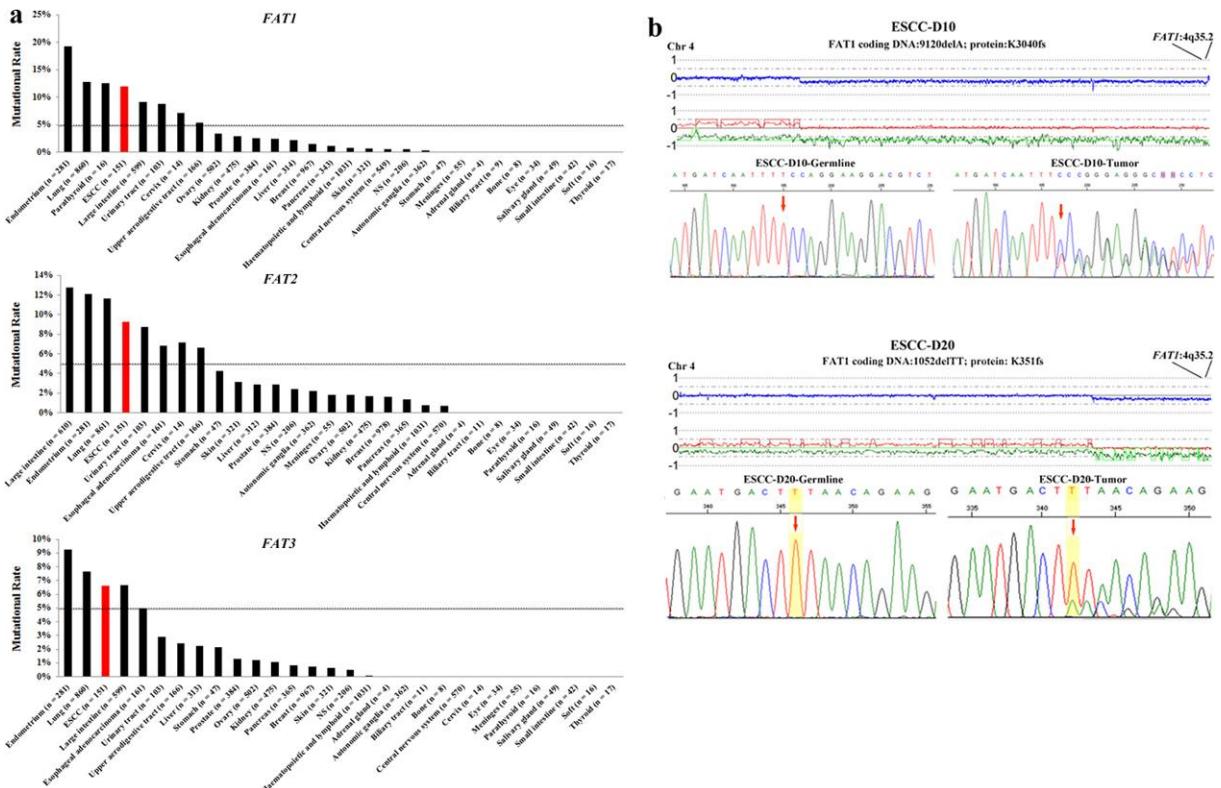

Supplementary Figure 3. Mutation types and signatures in ESCC

(a) The occurrence of the six types of base-substitution mutations observed in ESCC. (b) The occurrence of cytosine mutations at each group of trinucleotide, which shows biases toward mutations of TCN motifs. (c) Genes mutated in over 5% (≥ 7 cases) of the entire cohort.

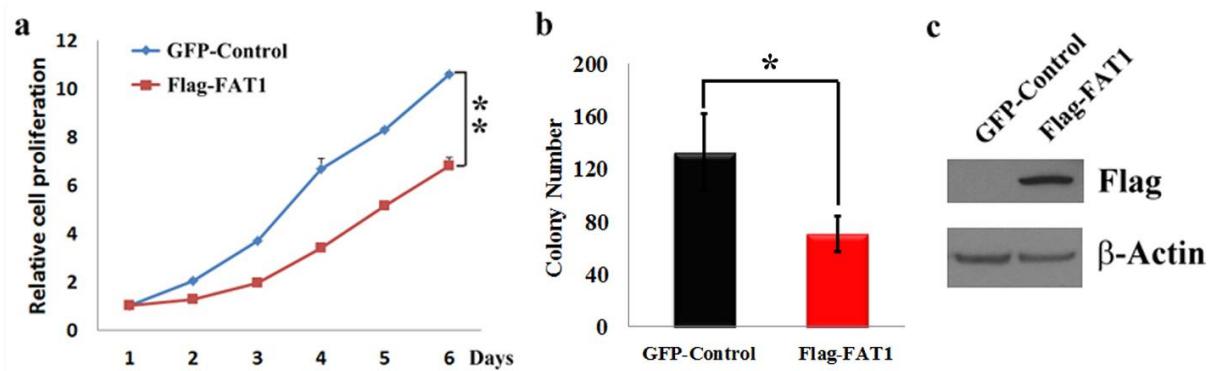

Supplementary Figure 4. Identification of ZNF750 as a novel recessive cancer gene in ESCC.

(a) Box plot showing relative ZNF750 mRNA levels in 1019 human cancer cell lines across 21 cancer types analyzed from CCLE database (see URL for the description of Box Plot). Number in the parentheses indicates the number of cell lines analyzed. (b) Summary of somatic mutations affecting ZNF750 across different tumor types including mutation data reported by The Cancer Genome Atlas (TCGA, see URL) and Catalogue Of Somatic Mutations In Cancer (COSMIC, see URL). Number in the parentheses indicates the number of cases sequenced. Concerning C-Mel/CSCC, in TCGA pathological reports, several cutaneous melanoma (C-Mel) patients with ZNF750 mutations also had cutaneous squamous cell carcinoma (CSCC). UASCC, upper aerodigestive squamous cell carcinoma; HNSCC, head and neck squamous cell carcinoma; CRC, colon and rectum adenocarcinoma; LG Glioma, lower grade glioma; AML, acute myeloid leukemia; GBM, glioblastoma multiforme; AG, autonomic ganglia carcinoma. Squamous cell carcinomas were highlighted with Orange Square. (c) Upper panel, mRNA expression of indicated terminal differentiation-related genes quantified with q-PCR in EC109 and KYSE180 cells transfected with either siRNAs against ZNF750 (siZNF750) or control siRNA (Scramble), as well as (lower panel) infected with lentivirus encoding either of ZNF750 protein (Flag-ZNF750) or GFP (GFP-control). WB results showing ZNF750 protein level in indicated samples. β-Actin was used as a loading control. Value represent mean \pm SD. N = 5. (d) Short-term cell proliferation assay of ESCC cells treated with control medium (DMSO) or TPA (100nM) for 5 days. N = 3. **, $P < 0.01$; *, $P < 0.05$.

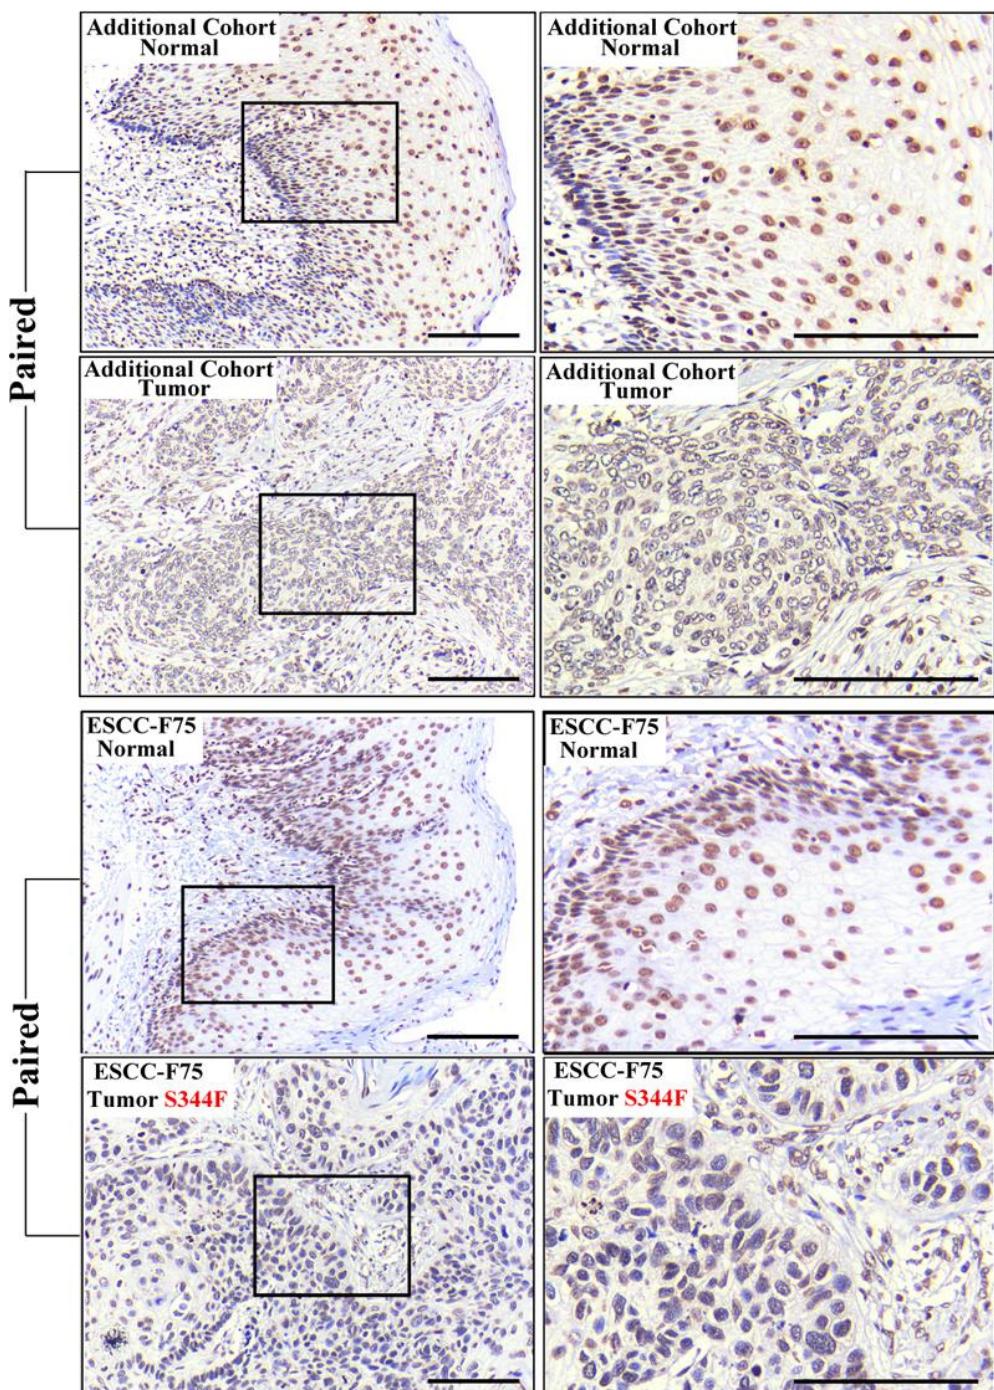

Supplementary Figure 5. *FAT* gene mutations and loss of heterozygosity.

(a) Summary of somatic mutations affecting *FAT1*, *FAT2* and *FAT3* across different tumor types from COSMIC. Number in the parentheses indicates the number of cases sequenced. (b) Inactivation of both alleles of *FAT1* in two ESCC cases. Upper panel, SNP-array data showing *FAT1* loss of heterozygosity in both tumors (ESCC-D10 and ESCC-D20, which were from Discovery Cohort). Blue line, total gene dosage; Green and red line, alleles-specific gene dosage. The number on the left indicates \log_2 tumor/reference ratio. Lower panel, Sanger sequencing signals confirmed the somatic mutations of *FAT1* in both cases. Arrows indicate the beginning of frameshift mutation bases in tumor DNA and the corresponding bases in germline DNA.

Supplementary Figure 6. The growth-suppressive properties of FAT1 in ESCC cells.

KYSE150 cells stably expressing either FAT1 protein (Flag-FAT1) or GFP (GFP-control) were subjected to (a) short-term cell proliferation assay or (b) soft-agar colony formation assay. (c) WB results showing FAT1 protein level. β -Actin was used as a loading control. Value represent mean \pm SD. N = 3. **, P < 0.01. *, P < 0.05.

Supplementary Figure 7. Down-regulation of FBXW7 protein expression in ESCC.

Representative FBXW7 IHC results of one ESCC case from Additional Cohort (Upper panel) and one ESCC case from Frequency Cohort with *FBXW7* mutation. Scale bars, 200 μ m.

Color types	Number
Validated as a true call by Sanger sequencing	337
Germline SNP	7
Validated as a false call by Sanger sequencing	18
Total Sanger events	362
True positive rate	93.1%
PCR failure due to: high GC content; difficulty in designing primers; poor signal of Sanger sequencing	82

Supplementary Table 4. FKPM value determined by RNA-seq of all the mutated genes in 4 ESCCs from Discovery cohort

Due to the limitation of space, only GO:0016568 category was shown here. The first row lists its sub-root (biological process, molecular function, or cellular component), category name, and corresponding GO ID. The second row lists number of reference genes in the category (C), number of genes in the gene set and also in the category (O), expected number in the category (E), Ratio of enrichment (R), p value from hypergeometric test (rawP), and p value adjusted by the multiple test adjustment (adjP). Finally, genes in the category are listed. For each gene, the table lists the user uploaded ID and value (optional), Entrez ID, Ensembl Gene Stable ID, Gene symbol, and description. Ensembl Gene Stable ID and Entrez Gene ID are linked to the Ensembl and Entrez Gene databases, respectively.

Supplementary Table 10. Potentially Actionable Targets in ESCC

Amplification **Missense/In-Frame** **Truncating** **Overexpression**

Due to the limitation of space, the total number of targeting molecules currently available for each gene was shown in brackets. Somatic mutations in cancer cell lines were summarized using both in-house data (Supplementary Table 11) and CCLE data (see URL). mRNA changes were calculated from both GSE23400 (n = 53) and GSE20347 (n = 17) datasets, and only identical changes in both studies are shown (p < 0.01, fold change > 2, see also Supplementary Table 12). See <http://clinicaltrials.gov/> and these studies^{15,16} for detailed information regarding targeting molecules. *, synthetic lethal with PARP inhibitors.

Supplementary Table 11. Summary of probable somatic mutations in ESCC cell lines
