

Supplemental Figure 1 Human serum, MGC cells, MCF-7 cells and XG6 cells were untreated, treated with β -ME, or with protein A plus β -ME. Both the 40- and 60-kDa α -chains produced by cancer cell lines were aberrant and truncated. The 55-kDa κ -chain was aberrant or at least incapable of binding the heavy chains. β -ME, β -mercaptoethanol; Ig, immunoglobulin.
