**Supplementary Figure S1: Effects of aminergic compounds on mosquito behaviour**

**profiles.** Females were injected with either PBS (control), 80mM tyramine (Tyr), 10mM citalopram (Cit), 10mM amitriptyline (Ami), 10mM amitriptyline + 10mM dopamine (Ami +Dop) or 10mM clenbuterol (Cle) and placed in a cup lying on their back. Using video recording we monitored the behavioural responses of single mosquitoes (total N=15 for 3

experiments) at various time points (15min, 30min, 45min, 1h and 3h) for a 1 minute period after injection. The data shown represent the mean ± SEM time (in %) a female spent for stationary (left panels: on back, upright) or any other type of behaviour (right panels). All combined behaviours add to a total of 100%. The different behaviour types were compared between PBS and compound using a Student's t-test (significance was indicated by p-value <0.05 and a red error bar).
