Supplementary Material and methods

Determination of KSHV genomic DNA sequence.

After extraction using Tri-reagent (MRC, Inc), 25 ng of genomic DNA (BC-3; BCBL-1; DG-75-K10/12) were used to PCR amplify the KSHV genomic region (119270-121967) in 25 μ L containing 1 U of Phusion enzyme (Finzyme), 1x HF Phusion buffer (Finzyme), and 0.5 μ M of forward primer 21.119 and reverse primer 24.91 as follows: 30'' at 98°C, followed by 35 cycles of 10'' at 98°C, 30'' at 55°C, 2 min at 72°C and a final 5 min at 72°C. The PCR products were purified on a 1% agarose gel and sequenced by GATC Biotech (France).

Table S3. Major KSHV miRNA-5p and -3p sequences obtained by deep sequencing.

For each miRNA, the major sequence obtained by deep sequencing and its fraction (among all the sequences retrieved for the given miRNA) is shown. In bold are indicated the residues in the sequenced RNA species that are different from the sequence reported in miRBase v.19 (www.mirbase.org) and that correspond or not (underlined) to the KSHV genomic sequence.

Table S4. IsomiRNAs, fraction in % of the different isoforms per miRNA. The different categories correspond to: full length (fl), 3' or 5' trimmed (3trim or 5trim), 3' or 5' tailed (3add or 5add) and every possible combination (5trim3trim, 5trim3add, etc). The miRNAs were either identical (id) or different (iso) to the template sequence.

SUPPLEMENTARY FIGURE LEGENDS

Figure S1. (A) Cluster of KSHV miRNAs. The twelve KSHV pre-miRNAs are localized in the latency locus and are indicated by red arrows. Ten of them are clustered in an intron (pre-miR-K1 to -K9 and pre-miR-K11) whereas pre-miR-K10 and -K12 are in the coding region and in the 3'UTR of Kaposin mRNA, respectively. Genomic coordinates of the intronic cluster of pre-miRNAs are 122209 to 119153.

(B) Positions of the RT primers used for SHAPE analysis. KSHV pri-miR-K10/12 is schematized with the 10 pre-miRNAs in black boxes. Letters (B to N) correspond to the 5' position of the oligonucleotides used for reverse transcription (see Table S1).

Figure S2. Pie chart representations of the different small RNA categories found in the libraries. Values were derived from Table S2.

Figure S3. Alignments of genomic DNA from KSHV cluster from various cell lines compared to the sequence in RefSeq.

The genomic sequences of the three cell lines used in this study (DG-75-K10/12, BCBL-1 and BC-3) were compared to the reference sequence (NC_009333.1). An asterisk indicates sequence variations, and point mutations or deletions are indicated in red. The 5p and 3p arms of the pre-miRNAs are indicated, with the most abundant forms in dark grey and the less abundant in light grey. Genomic positions are indicated.

Figure S4. KSHV miRNA offset RNA (A) and antisense miRNA (B) detection by northern blot analysis.

40 μ g of total RNA from DG-75-K10/12, BCBL-1 and BC-3 cell lines were loaded on a 15% PAGE and submitted to northern blot analysis. Total RNA from DG-75-EGFP, expressing no KSHV RNAs, was used as a negative control. Bands corresponding to moRs and AS-miRNAs are indicated by an asterisk. U6 RNA was probed as a loading control. A ladder is indicated next to the autoradiograms.

Figure S5. Secondary structure of KSHV miRNA stem-loops.

MiRNA stem-loops composed of the pre-miRNA plus ~20 nucleotides before and after the Drosha cleavage site are represented. SHAPE reactivity of each nucleotide is indicated. Arrows correspond to cleavage by RNase T1 (after single stranded G residues). Asterisks

indicate the UG motif at -14 and -13 from the 5' of the cleavage site. The most abundant sequences of the miRNA-5p and -3p and the different isoforms are indicated in black and in grey respectively, along with the number of reads obtained by deep sequencing. Non-template nucleotides found at the ends of the miRNA are shown. For some pre-miRNAs, microRNA offset RNAs (moRs) were sequenced and are indicated in grey. They are localized upstream of the miRNA-5p and present variations at their 5' end (as indicated by short lines in grey) whereas the 3' extremity is invariant.

Figure S6. Additional mutants of sub-optimal miRNA stem-loops.

miR-K2 (A) and miR-K5 (B) were mutated to optimize their secondary structure. The resulting mutants were cloned in the pcDNA-K10/12 expression plasmid. The resulting constructs were then transfected in HEK293Grip cells and total RNA was analyzed by northern blot for the studied miRNA. miR-16 was probed as a loading control. Inserted nucleotides derived from the miR-K6 stem-loop are indicated in blue, red crosses indicate deletions.
