Supplementary Table S3: Variance partitioning results obtained by using partial redundancy analyses for ROV dives on the summit (dive 036) and flanks of the HTS (dives 035 and 037). Adjusted explained variation is an adjusted coefficient of determination summarising the variability in species composition explained by purely environmental (environment), purely geographic distance (space), or by the fraction of spatially structured environmental (environment*space) fractions along with their degrees of freedom (df; number of variables including their categories). NA refers to the value being not applicable because it cannot be computed.
