B

C**panel D**

Supplementary Figure 1: Phylogenetic relationships among *ppc-1* genes.

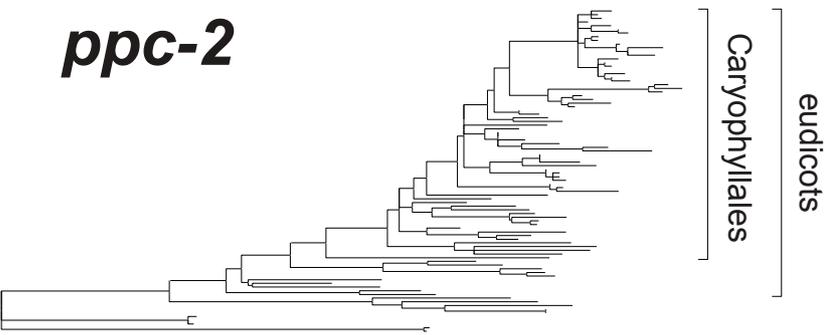

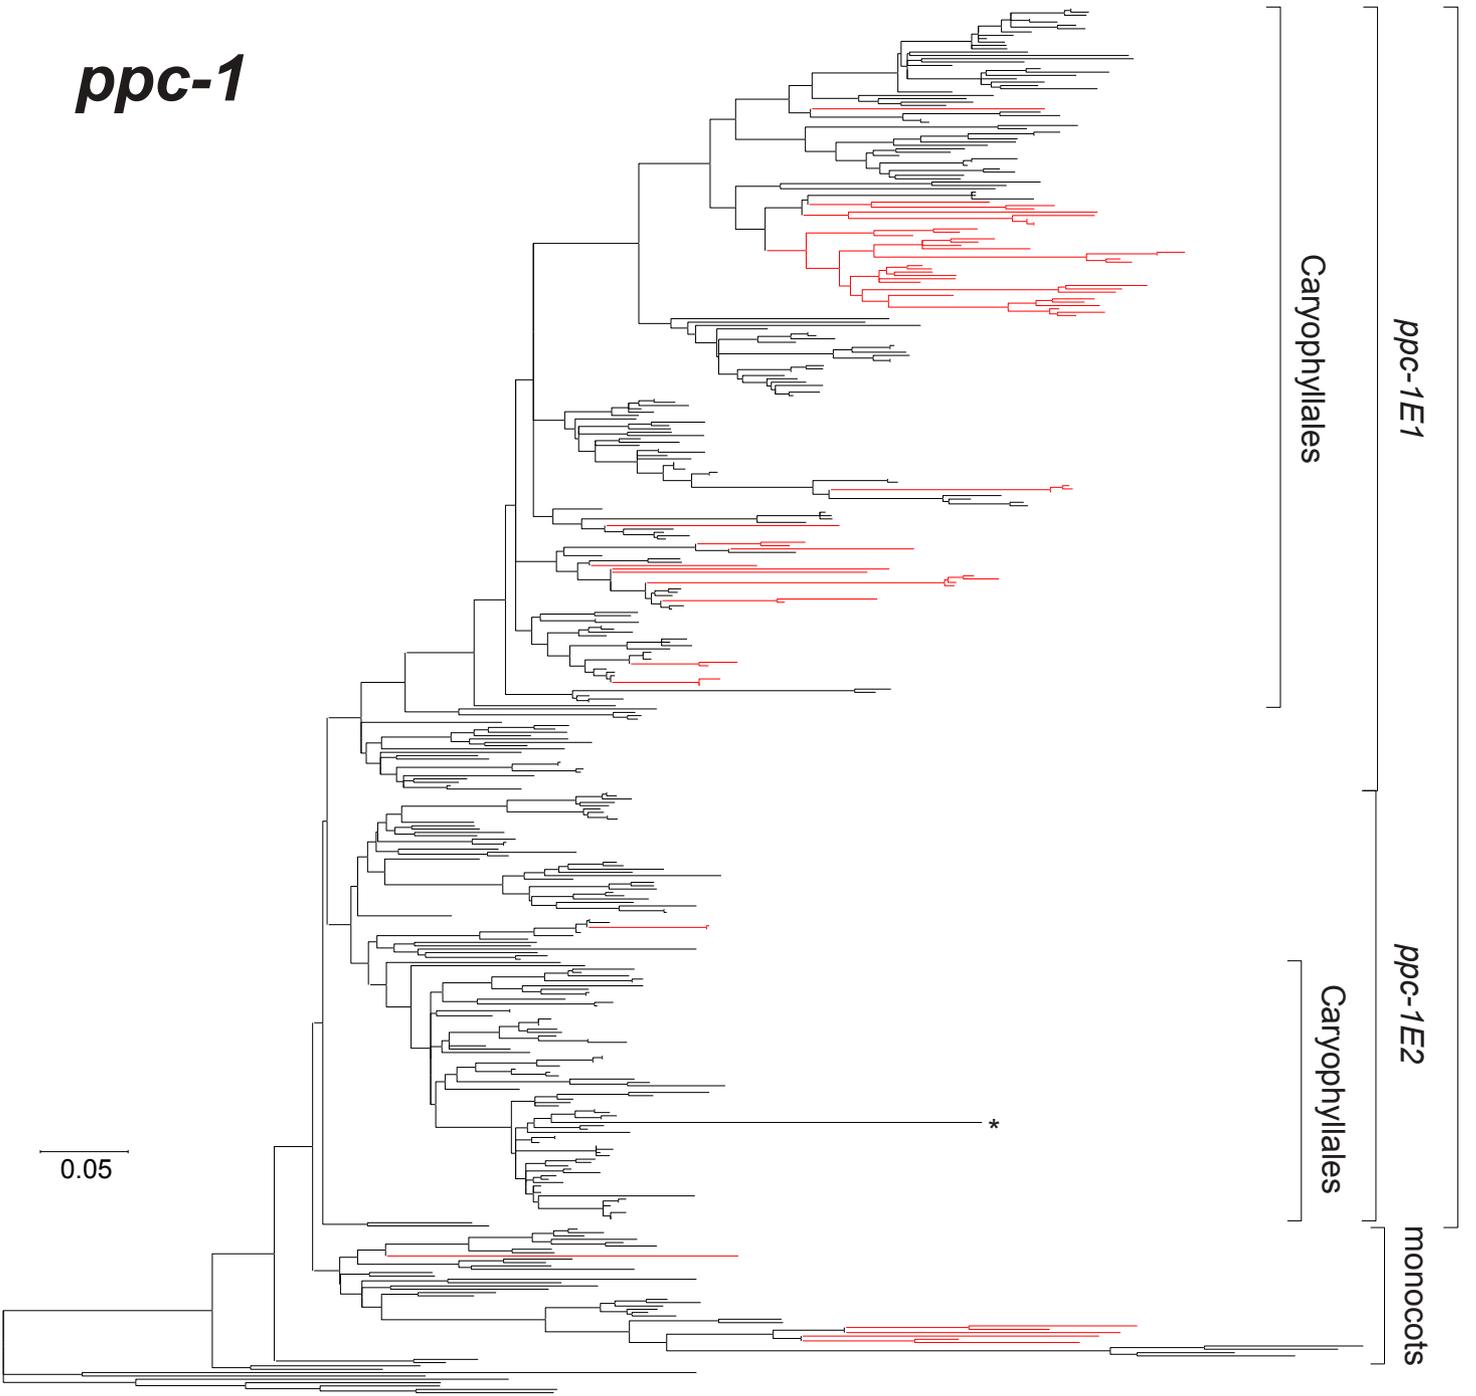

This phylogenetic tree was obtained through Bayesian inference on nucleotide sequences. Names of taxonomic groups and gene lineages are indicated on the right. Branches in lineages presenting a Ser780 are highlighted in red. Bayesian support values are indicated near branches. Asterisks indicate putative pseudogenes with one or several stop codons in the coding sequence. Black circles indicate sequences that were isolated from cacti cDNA. **A** Complete phylogenetic tree, **B** *ppc-1E2* of Caryophyllales, **C** and **D** *ppc-1E1* of Caryophyllales.

0.05

Supplementary Figure 2: Phylogenetic relationships among *ppc-2* genes.

This phylogenetic tree was obtained through Bayesian inference on nucleotide sequences. Names of taxonomic groups are indicated on the right. Bayesian support values are indicated near branches.

Supplementary Figure 3: Amino acid changes on genes encoding PEPC.

The topology was inferred on nucleotide sequences, but branch lengths were estimated based on amino acid sequences. The branch lengths inferred on nucleotide sequences, together with all species names and support values, are available in Figures S1 and S2. The names of the main groups are indicated on the right. Groups of genes containing a Ser780 are highlighted by red branches. The asterisk highlights a pseudogene with multiple stop codons.

Supplementary Table 1: Sample of Caryophyllales (excluding Portulacineae) used for analyses of PEPC encoding genes.
