

Supplementary figure 1 | Analysis of recombination beyond the 2L genomic island. Lines show proportionate M form ancestry for each individual in the M-*kdr* group based on ancestry informative markers (fully diagnostic of M and S) on the centromere proximate 5Mb of the 2R chromosome arm.

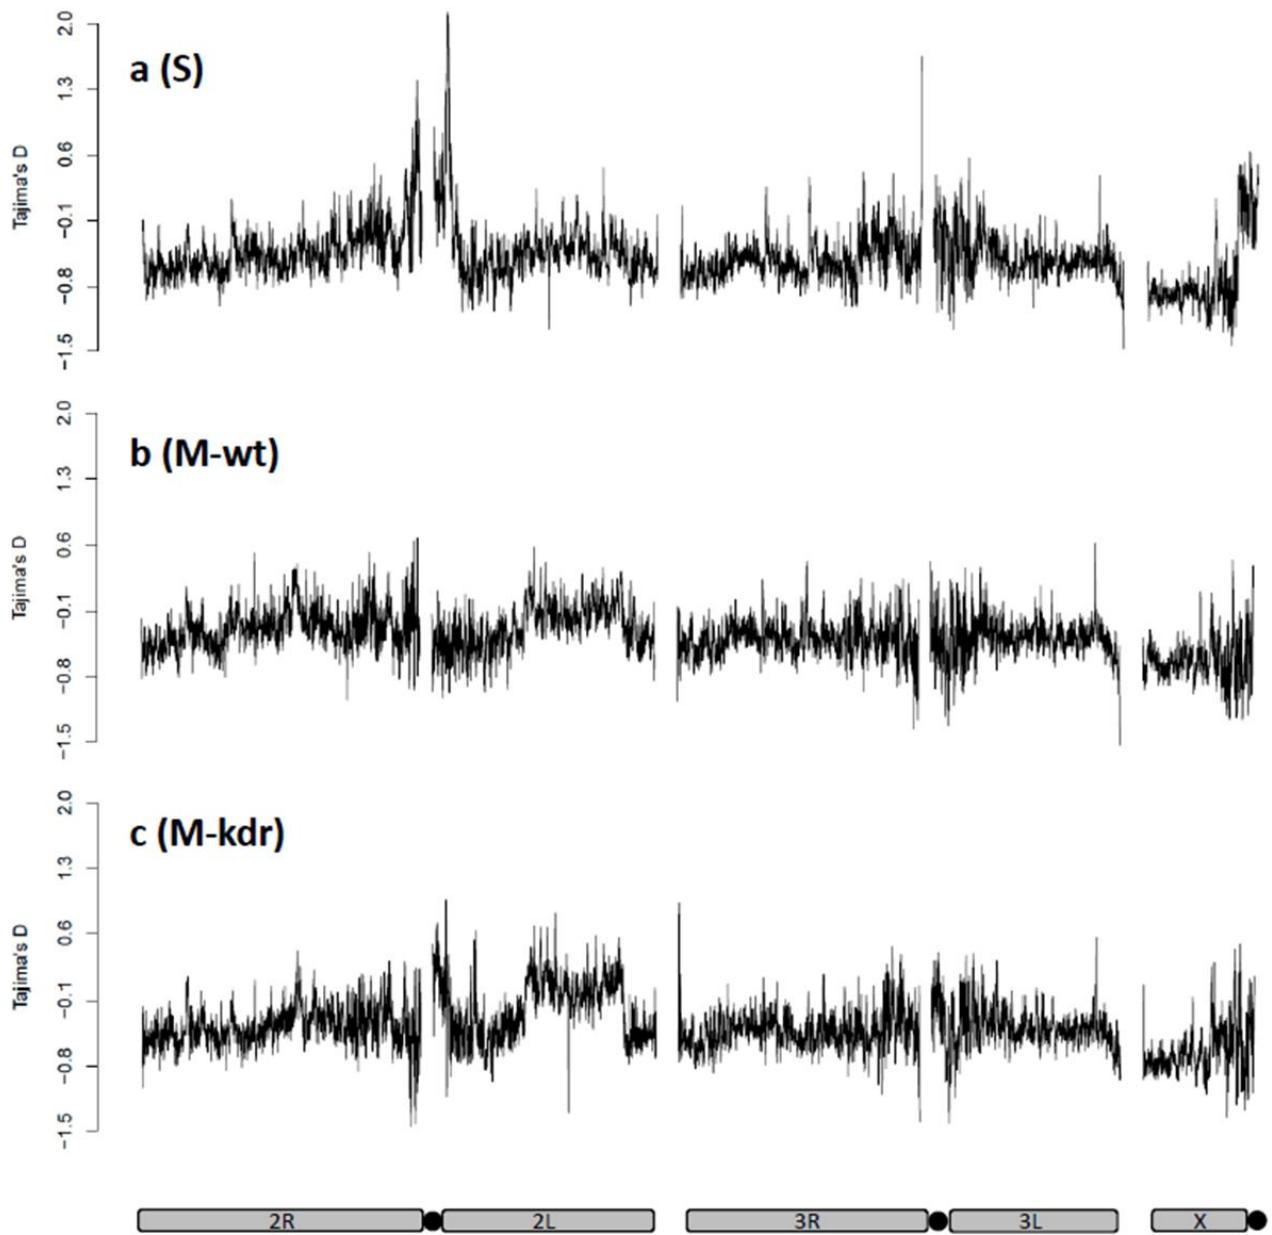

Supplementary figure 2 | Scatterplots showing the relationships between the size of divergent genomic islands and descriptive statistics for diversity and differentiation. Plots demonstrate the relationship between island size and (a) Maximum d_f , (b) Mean d_f , (c) SNP frequency within islands and (d) the mean number of genes per window. Points in each plot points are islands (total N=117). Owing to heterogeneity in island size a log scale is used in each plot; the major 2L genomic island is indicated.

Supplementary figure 3 | F_{ST} -based pairwise divergence between M-wt and S *A. gambiae* with number of variants per window. The plot describes mean F_{ST} (blue) and the number of variants (red) in 100 SNP stepping windows across the whole genome (all chromosome arms) for M-wt vs. S.

Supplementary figure 4 | Dxy–based pairwise divergence between M-wt and S. A. gambiae. Dxy calculated between M-wt and S. A. gambiae across the genome (all chromosome arms) in 50kb stepping windows.

Supplementary figure 5 | Whole genome Tajima's D for the three groupings of *A. gambiae*. Plots are based on Tajima's D calculated in 50kb stepping windows for (a) S form, (b) M-wt and (c) M-kdr. Chromosomes are shown by solid grey bars and centromere positions by black circles.

Supplementary Table 1 | Statistics associated with kernel plots of chromosomal differentiation

	2L	2R	3L	3R	X
Mean F_{ST}	0.0294	0.0545	0.0171	0.0225	0.0453
F_{ST} 95% CI ±	0.0006	0.0004	0.0004	0.0004	0.0018
Sample Skewness (G1)	4.362	1.367	2.440	2.495	2.870
