**Table 1. Data used for model fitting.** Each row corresponds to a time course of either mRNA or protein concentration in some light condition, extracted from the listed publications. All time courses were given a weight  $w_i = 1$  unless otherwise specified here. Increased weights were used where important results were otherwise found to be difficult to reproduce: *CCA1* oscillations in *toc1* [3], ZTL protein level in wt and mutants [26], interaction between *elf3* and *cca1;lhy* [6], period lengthening in *prr7;prr9* [9], small effects of PRR7-ox [10], small period shortening in PRR9-ox [37], and level changes and period preservation in PRR5-ox [44, 51]. Decreased weights were used for some DD data where the system became arrhythmic in wt [28]. Experimental data was obtained in many different light conditions, which were simulated in the model. LD, LL and DD refers to light/dark, constant light and constant dark, respectively. Numbers such as 12:12 refer to hours of light and dark per period during entrainment, and for LD also during measurements. RR is constant red light, which was simulated as LL. Data were not manipulated in any way (e.g. stitched, joined or normalized) before entering the costfunction described in Methods in the main text. All raw data are available from the website mentioned in main text.
