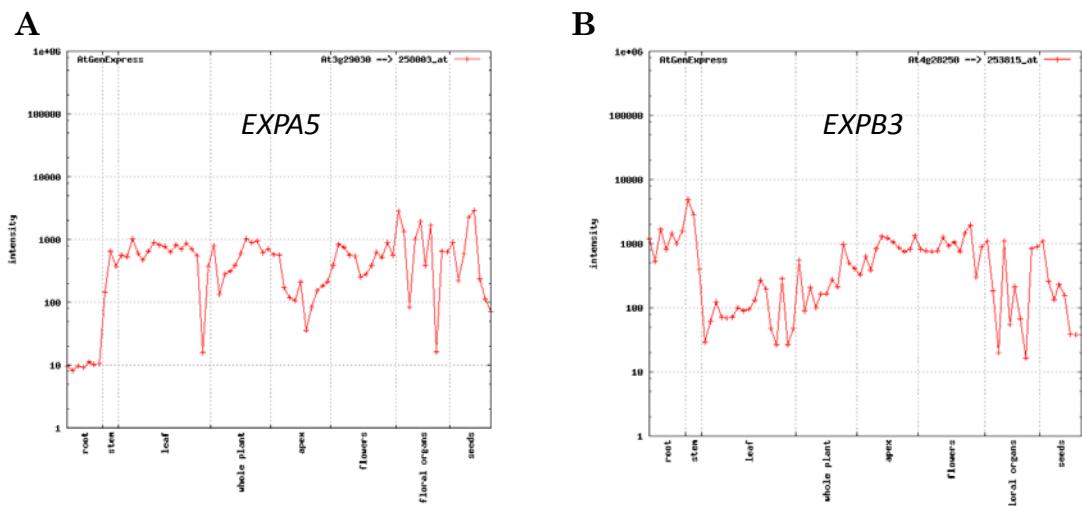

Figure S1. *EXPA5* (A) and *EXPB3* (B) expression pattern by AtGenExpress Visualization Tool (AVT).

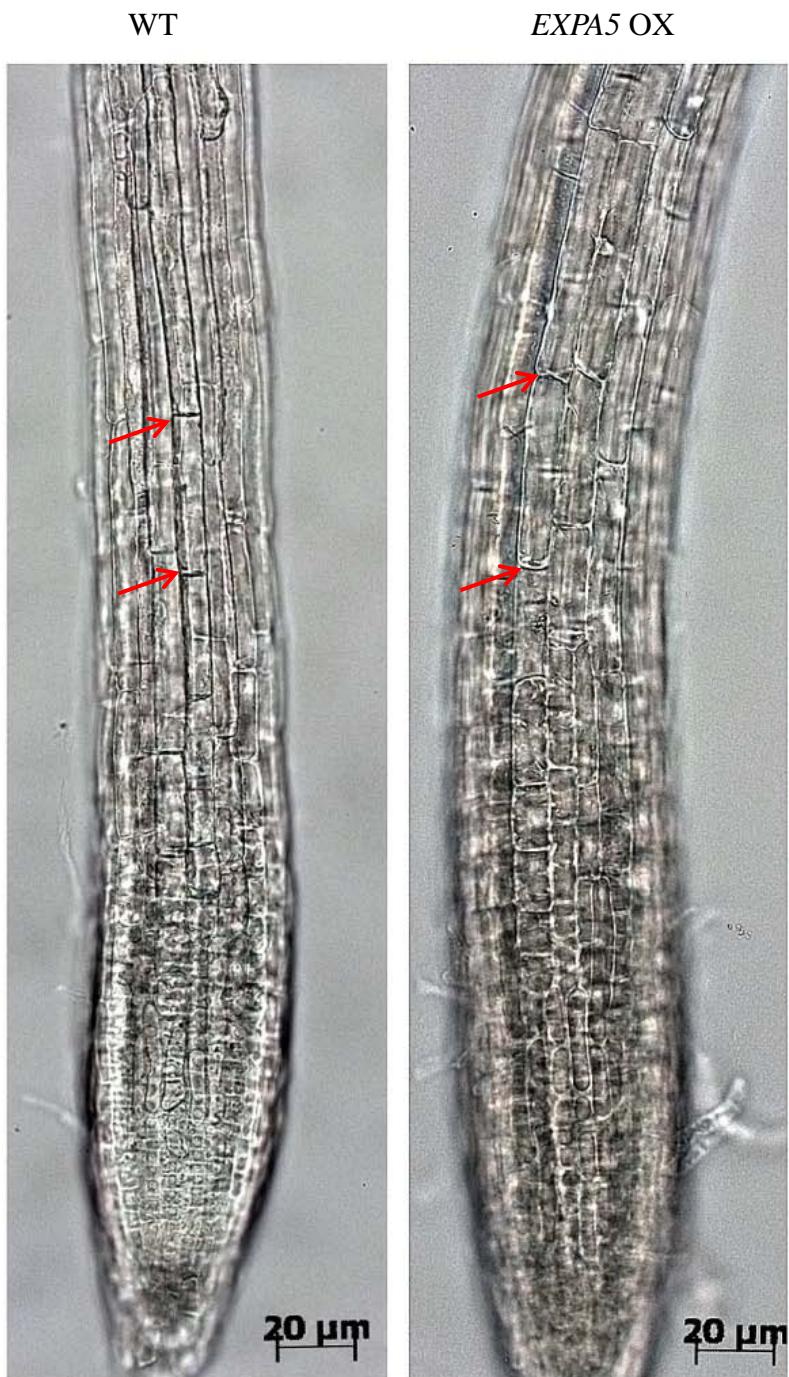

Figure S2. The cells in elongation zone of *EXPA5*-overexpressing line is longer than that of the wild type. The cell between two arrows is the fifth cell of elongation zone.

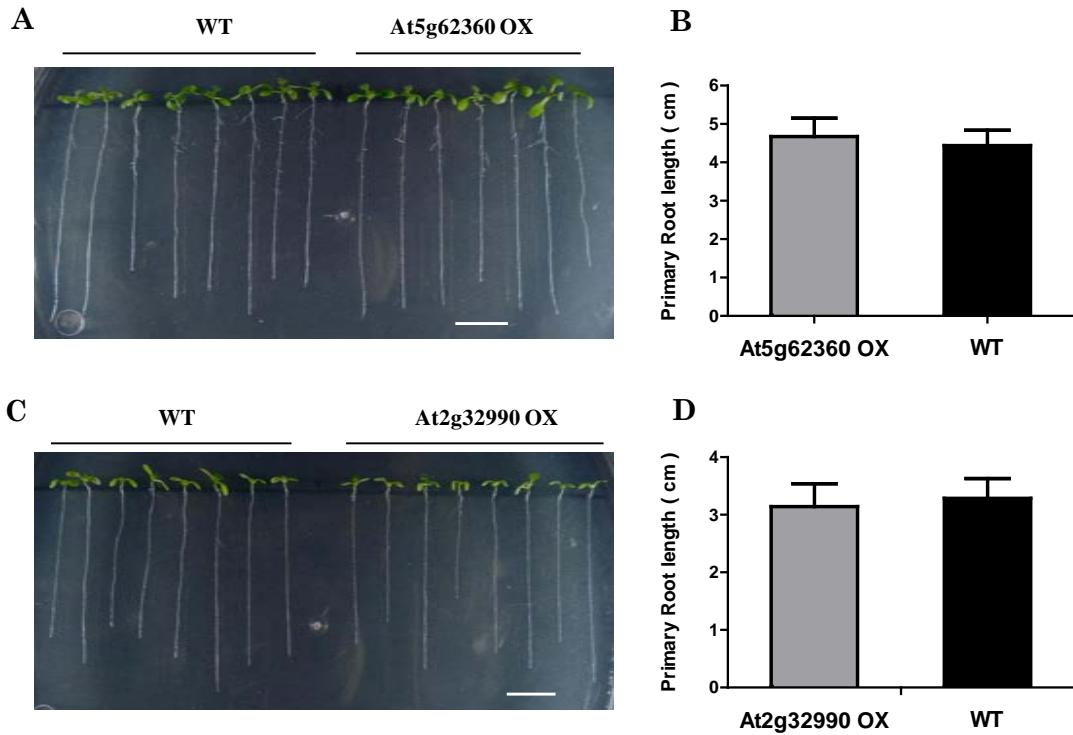

Figure S3. The root architecture of PMEI (At5g62360) or CEL (At2g32990) overexpression transgenic plants.

- A. The primary root of 8-d-old wild type and PMEI over-expression transgenic plants on MS medium.
- B. The primary root length of plants shown in (A). Presented are means \pm SD ($n = 3, >50$ seeds per replicate experiment). There was no significant difference between wild type and transgenic plants.
- C. The primary root of 8-d-old wild type and CEL over-expression transgenic plants on MS medium.
- D. The primary root length of plants shown in (C). Presented are means \pm SD ($n = 3, >50$ seeds per replicate experiment). There was no significant difference between wild type and transgenic plants.
