

Figure S8: P₃₀ (99.6% CI) of the CKD-EPI and the MDRD Study equation across levels of measured GFR. Bars represent simulated (2000 simulations for each 1.0 ml/min/1.73 m²) confidence intervals of the P₃₀ of the CKD-EPI (grey) and the MDRD Study equation (black) plotted against measured GFR. Outliers were excluded by only including mGFR values lying in 2.5%-97.5% of the distribution.
