

**Supplementary Figure 1:** Signature chromatographic pattern (XIC) of double transition peaks for peptide with double and triple charges. Normally, four transition peaks (two transitions \* two precursor states (2+ and 3+)) corresponding to one peptides will be observed for positive peptides, as in the cases of peak A-E. For false positive peptides, only one or two transitions peaks could be seen, as in the cases of peak F and G.

**Supplementary Figure 2:**  
Performance of ELISA/Luminex kits for SHBG (A), SAA1 (B) and CP (C). Results suggest that kits for SHBG and SAA1 are excellent while the ELISA kit for CP has a very narrow linear range.

**Supplementary Figure 3:** Correlation between the two transitions derived from two different peptides of CP for neat serum samples from 20 individuals.

**Supplementary Table 1: Transitions selected for monitoring SAA1, SHBG and CP.**

Protein	Peptide	Charge	Transition	Fragmention	CE
SAA1	SFFSFLGEAFDGAR**	2+	775.9/822.4*	y8	43.793
			775.9/935.5	y9	
	GPGGVWAAEAISDAR	2+	728.9/832.5*	y8	41.443
			728.9/761.4	y7	
	GPGGVWAAEAISDAR	3+	486.2/632.3*	y6	24.395
			486.2/561.3	y5	
SHBG	TWDPEGVIFYGDTNPK	3+	613.6/631.3*	y6	29.999
			613.6/794.4	y7	
	TWDPEGVIFYGDTNPK**	2+	919.9/941.4*	y8	50.996
			919.9/1054.5	y9	
	IALGGLLFPASNLR	2+	721.4/804.4*	y7	41.071
			721.4/917.5	y8
