Parent Obese			2.329** (0.09)	
N	15,604		15,604	

π_0 denotes the covariate-specific intercepts at baseline (age 11), while π_1 denotes the covariate-specific BMI slopes over the course of the observed period. Reference category for parental education is less than high school.

<i>Tests of Coefficient Equality</i>						
Race/Ethnic Slopes						
x ² (5)	32.64		15.25		22.70	
p > x ²	0.00		0.00		0.00	
Parental Education Slopes						
x ² (3)	0.66		1.75		29.25	
p > x ²	0.88		0.63		0.00	
N	1,364		2,261		11,976	

π_0 denotes the covariate-specific intercepts at baseline (age 11), while π_1 denotes the covariate-specific BMI slopes over the course of the observed period.

The reference categories are as follows: for mother's education, less than high school; for race/ethnicity, non-Hispanic white. Models also control for adolescent sex, marital status, logged family income and parental obesity.

[†]<.10; * p<.05 ; ** p <.01

a, b, and c denote significant within-row differences from intercepts or slopes from panels A, B, or C, at the $p < 0.05$ level.

NHW = Non-Hispanic White; East As. = East Asian; Oth. As. = Other Asian

Standard errors are in parentheses. Probabilities are adjusted for all covariates listed in Table 2, which are held constant at their means. N = 1,364 (first gen.), 2,261 (second gen.), 11,976 (third gen.)

* denotes significant within-row differences from NHW adolescents, for race/ethnicity; and significant difference from less than HS, for parental education, at the $p < 0.05$ level.
