

SUPPLEMENTARY FIG. S2. miR-147b is induced upon ischemia. The levels of miR-147b were measured in the gastrocnemius muscle by qPCR, 3 days after ischemia induction ($n=8$). In both SCR and anti-miR-210-treated mice, miR-147b levels were undetectable in non ischemic muscles ($Ct > 35$). In ischemic muscles, miR-147b was detectable in both SCR and anti-miR-210-treated mice ($Ct < 35$). Ct levels of a control miRNA (miR-16) were similar in all groups. Ct-35 threshold is indicated. qPCR, quantitative real-time PCR; SCR, scrambled.
