Table S1. (A) Identifying individual spectra from *S. roseosporous* (SR), *S. pristinaespiralis* (SP), *B. subtilis* (BS), and *B. brevis* (BB) extracts. For the spectra that can be dereplicated from the Norine dataset with p-value less than 10^{-10} , the corresponding peptide is shown. (B) Rescoring results of part (A) by spectral networks using multitag algorithm.¹³ The gene clusters correspond to the known NRPs arylomycin, daptomycin, pristinamycin, surfactin, plipastatin, and tyrocidine, respectively. SpecNetScore is shown for each peptide. Brackets stand for cyclic/branched-cyclic structure, and superscripts stand for modification masses.(C) Correct structure of peptides produced by these organisms (only most abundant species is shown for each peptide family)

NRPquest webserver user manual guide

NRPquest webserver is available at cyclo.ucsd.edu. The user can upload their genomic and mass spectral datasets, and the webserver reports all the significant hits between the spectral dataset and NRPs predicted from the genomic datasets. Samples of datasets used in this paper from bacterial strains *Streptomyces roseosporous* NRRL 15998, *Streptomyces pristinaespiralis* ATCC 25486, *Bacillus subtilis* subsp. *subtilis* str. NCIB 3610, and *Bacillus brevis* ATCC 8185 are provided. The runtime is about 1 min/spectrum. **Fig. S1** shows a snapshot of how the webserver works for *Bacillus subtilis* str. NCIB 3610 dataset.
