Gray shaded box denotes statistically significant difference at $p < 0.05$.

^aOne CT/MRI-positive mTBI patient with unknown employment status was not included in this analysis.

^bOne control with unknown handedness was not included in this analysis.

^cOne CT/MRI-positive mTBI patient with PTA less than 24 h, but not otherwise specified, was not included in this analysis.

^{d,e}Each superscript denotes a subset of participants whose proportions do not significantly differ from each other at $p < 0.05$ by Pearson's χ^2 test (or Fisher's exact test when expected cell count < 5).
CT, computed tomography; MRI, magnetic resonance imaging; mTBI, mild traumatic brain injury; ANOVA, analysis of variance; GCS, Glasgow Coma Scale; PTA, post-traumatic amnesia; LOC, loss of consciousness.
