Supporting Information Fig S7: Analysis of TGF-β2 and TNF expression in MCD-induced NASH.

(A) *TNF- α* and (B) *TGF- β 2* mRNA levels were assessed by RT-PCR in the indicated genotypes, values were calculated relative to WT mice fed with normal show and β -catenin was used as an internal standard, n=6 per group. § (* P <0.05) indicates mRNA levels are significantly increased compared to basal values in the WT group.
