

Figure S3. Population of infiltrating cells in the pancreatic islets of NOD mice after streptozotocin and SB225002 treatments. Pancreatic islet cells from 6-wk-old NOD mice were recovered 12h after STZ injection (i.p. 80mg/kg) and infiltrating cells were analyzed by flow cytometry. Percentage and absolute number (in brackets) of each population is represented. Data are representative of 2 independent experiments each with 2 pooled mice per group.
