

**Figure S7. Population of infiltrating cells in the pancreatic islets of 3-wk-old NOD mice after anti-IL1 $\beta$  treatment.** NOD mice were treated between 10 and 20 days of age (4 injections of anti-IL1 $\beta$  mAb, 200  $\mu$ g/mouse/injection). Pancreatic islet cells were recovered and analyzed by flow cytometry. Percentage of each population is represented after gating on CD45<sup>+</sup> cells. Data are representative of 3 independent experiments.
