

Figure S9. CXCL2 expression by macrophages after culture with Min-6 β -cells. Purified pancreatic macrophages from 3-wk-old NOD mice were cultured 48 h alone or with Min-6 β -cells in a Transwell system (macrophages in the down chamber and Min6 cells in the upper chamber) for 48h in the presence of Brefeldin A the last 4h. Then macrophages were stained for CD11b and F4/80 surface expressions and for CXCL2 intracellular expression. Data are mean values \pm SEM from two independent experiments each performed with two pools of two mice.
