Figure S1. Sequence alignment of human ALDH1A1 and sheep ALDH1A1 highlighting the conserved residues located in active site. Residues in the active site are 100% identical in both human and sheep. Trp177, which is crucial for CB7 binding is highlighted in blue which is also identical between sheep and human ALDH1A1.

Figure S3. ALDH3A1 expression in A549, SF767, and CCD-13Lu cells. Lysates from various cancer cell lines (A549, SF767, and CCD-13Lu) were examined for ALDH3A1 expression. Purified recombinant His-tagged ALDH3A1 protein is taken as positive control and GAPDH serves as a loading control. Purified recombinant ALDH3A1 shows a slightly higher band because it is His-tagged and travels slowly on SDS-PAGE gel.

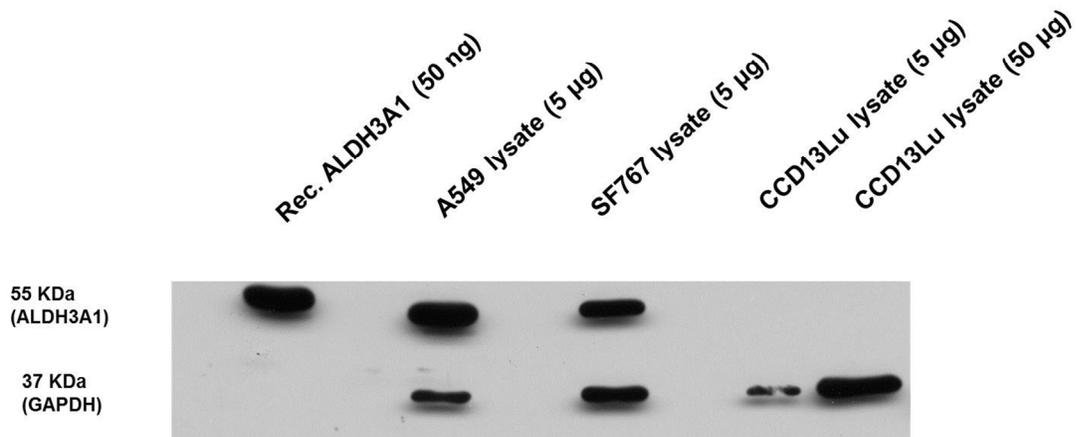

Figure S4. ALDH1A1 expression in A549, SF767, and CCD-13Lu cells. Lysates from various cancer cell lines (A549, SF767, and CCD-13Lu) were examined for ALDH1A1 expression. Purified recombinant ALDH1A1 protein is taken as positive control and GAPDH serves as a loading control.

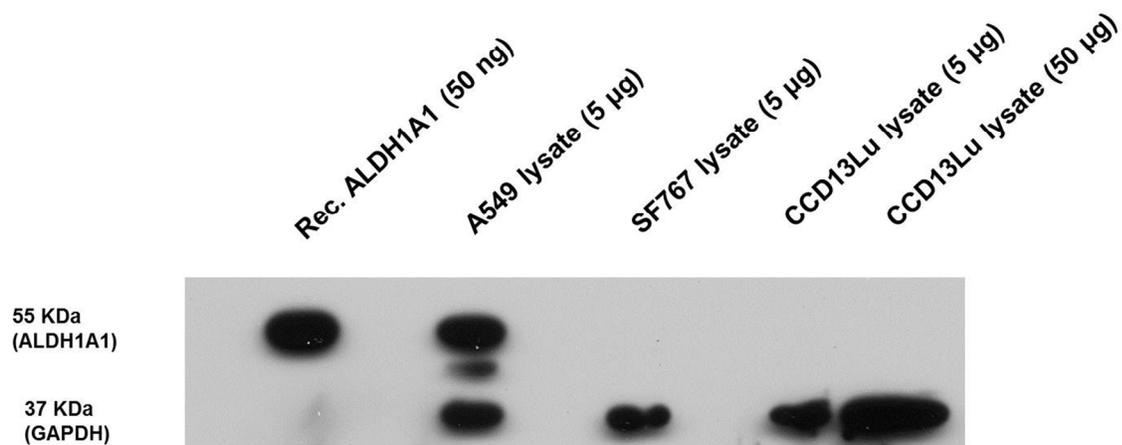

Figure S5. Cross reactivity of ALDH1A1 antibody. Figure shows the cross reactivity of ALDH1A1 antibody, Abcam (ab-23375) with other ALDH subtypes. Human ALDH1 isoforms (ALDH1A1, ALDH1A2, ALDH1A3, and ALDH1B1) and ALDH2 were purified in the lab and were provided by Lanmin Zhai. Each lane was loaded with between 50 and 70 ng of the purified recombinant human ALDH1A1, ALDH1A2, ALDH1A3, ALDH1B1 and ALDH2 isoenzymes respectively and was detected using ALDH1A1 antibody.
