

Supplementary Fig. 1.

Axial sections through HREM data of wild-type E14.5 mouse embryos. Selected important features are labelled. **a.** Volume rendered 3D model with one original section plane (p). Scalebar = 1mm. **b.** Section at the position indicated in a. Inlay shows the vagus nerves (arrows) lateral to the pulmonary trunk (pt) and ductus arteriosus (continuation of pt) respectively. **c.** Section through the neurocranium. The internal capsule is indicated by a box and magnified in the inlay. Note the choroid plexus (cp) of the 4th ventricle (iv). **d.** Section at the level of the eyes (eb). **e.** Magnification of the region boxed in d (orbit). Note the eye muscles (em) and the fibers forming the retina (rf) and the optic nerve (on). **f.** Section at the level of the glenohumeral joint (ghj). Note in the top inlay the cranial pole of the right thymus (th) and the isthmus of the thyroid gland (ty) ventral to the trachea (tr). Note in the bottom inlay the vertebral artery (va) in the foramen formed by the transverse process of the vertebra. An oval surrounds the common carotid artery, vagus nerve, and internal jugular vein. **g.** Section at the level of the gall bladder (gb). **h.** Magnification of the region boxed in g. Note the umbilical vein (uv), the mesenteric vessels (mv) and the physiologic umbilical hernia. **i.** Section at the level of the para-aortal bodies (pmg). Note in the top inlay the suprarenal gland (sg). Note in the bottom inlay the ureter (ur) and umbilical artery (ua).

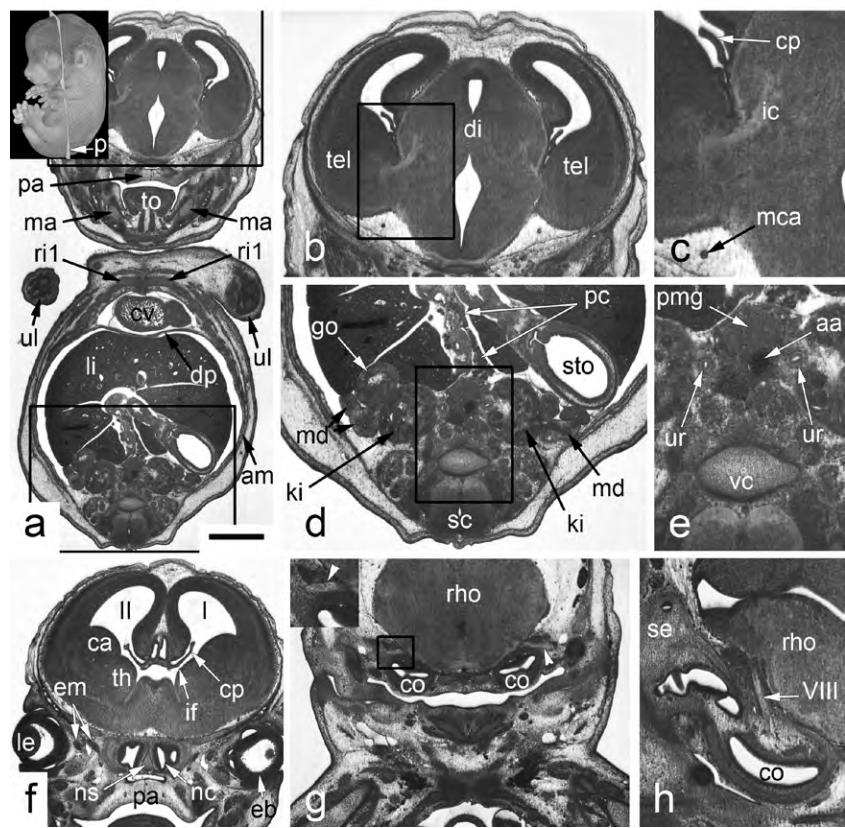

[aa, abdominal aorta; aao, ascending aorta; ba, basilar artery; ca, caudate nucleus; co, cochlea; cp, choroid plexus; da, descending aorta; di, diencephalon; dp, diaphragm; e, esophagus; eb, eye ball; em, eye muscles; fem, femur; g, spinal ganglion; gb, gall bladder; ghj, glenohumeral joint; go, gonad; I, 1st ventricle; ihm, infrahyoid muscles; II, 2nd ventricle; III, 3rd ventricle; in, intestine; IV, 4th ventricle; ivc, inferior vena cava; ki, kidney; lat, left atrial appendix; li, liver; llu, left lung; lol, lower limb; ls, lymph sac; lvc, left vena cava superior; ma, mandible; mv, mesenterial vessel; nc, nasal cavity; ns, nasal septum; ob, occipital bone; on, optic nerve; p, pinna; pc, pancreas; pm, pectoralis muscle; pmg, para-aortal bodies; pt, pulmonary trunk; rat, right atrial appendix; rf, retinal fibres; rho, rhombencephalon; ri, rib; rlu, right lung; rv, right ventricle; rvc, right vena cava superior; sag, salivary gland; sc, spinal chord; sg, suprarenal gland; spl, spleen; st, subcutaneous tissue; sto, stomach; t, tail; ta, tooth primordium; tel, telencephalon; tg, trigeminal ganglion; th, thymus; to, tongue; tr, trachea; ty, thyroid gland; ua, umbilical artery; ul, upper limb; ur, ureter; uv, umbilical vein; va, vertebral artery; vc, body of vertebra; vcj, costovertebral joint].

Supplementary Fig. 2.

Virtual sagittal re-sections through HREM data of wild-type E14.5 mouse embryos. Selected important features are labelled. **a.** Re-section through the embryo displayed in the inlay on the left. Note the section plane (p). Scalebar = 1 mm. Magnifications of the boxed areas are displayed as inlays on the right. Most cranial box corresponds to uppermost inlay. Note the internal carotid artery (ica), vertebral artery (va), spinal ganglion (g2) and spinal nerve (sn2) C2, diaphragm (dp), and ureter (ur) in the center of the pelvis of the kidney (ki). **b.** Anterior cerebral artery (aca) and pineal gland anlage (pg). Note the commissural fibers (cf), and adenohypophysis (ah). **c.** Nerve fibers innervating the vibrissae (vf) and cranial nerves IX, X, XI inside and below the jugular foramen. Note the ganglion of the vagus nerve (arrowhead), trigeminal ganglion (tg), and the eye muscles that surround the optic stalk (os). **d.** Urethra (ura), rectum (rec), and urinary bladder (ub). Note the distally enlarged mesonephric duct (md). **e.** Larynx (la). Note the laryngopharynx (lp) and the remnants of the notochord (nco) in the forming vertebral column. **f.** Lumbar part of diaphragm (pld). Note the openings for esophagus (e) and descending aorta (da). **g.** Eye (eb) and shoulder. Note the infraspinatus muscle below the spina scapulae (scs). **h.** Radius (ra) and ulna (ua), tibia (ti) and fibula (fi). Note the cubital joint and the knee joint.

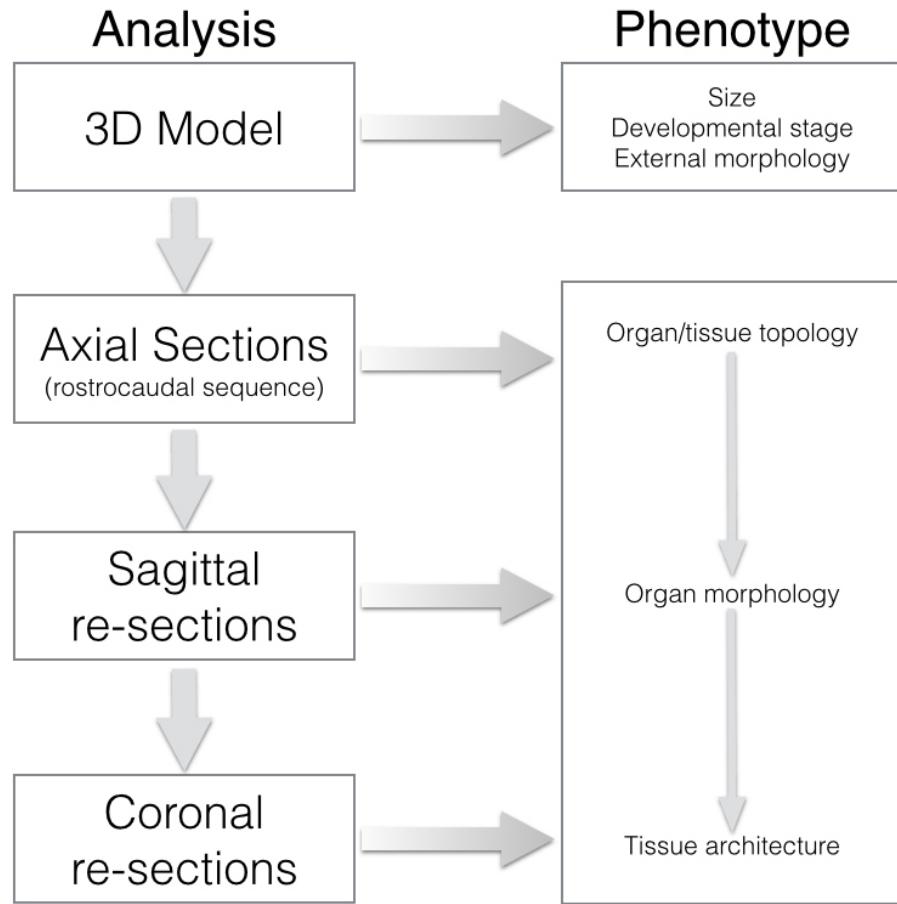

[aca, anterior cerebral artery; ah, adenohypophysis; at, atrial appendix; cf, commissural fibers; cl, clavicle; co, cochlea; cv, cardiac ventricle; c1, atlas; da, descending aorta; di, diencephalon; dp, diaphragm; du duodenum; e, esophagus; eb, eye ball; fem, femur; fi, fibula; g2, spinal ganglion; hb, hyoid bone; hu, humerus; ica, internal carotid artery; III, 3rd ventricle; ivc, inferior vena cava; ki, kidney; la, larynx; li, liver; lol, lower limb; lp, laryngopharynx; lu, lung; ma, mandible; md, mesonephric duct; me, mesencephalon; nco, notochord; ns, nasal septum; os, optic stalk; pa, palatine; pc, pancreas; pg, pineal gland anlage; pld, Lumbar part of diaphragm; ra, radius; rec, rectum; rho, rhombencephalon; ri, rib; scs, spina scapulae; sg, suprarenal gland; sn2, spinal nerve; ti, tibia; tel, telencephalon; tg, trigeminal ganglion; to, tongue; ua, ulna; ub, urinary bladder; ul, upper limb; ur, ureter; ura, urethra; uv, umbilical vein; va, vertebral artery; vc, body of vertebra; vf, nerve fibers innervating the vibrissae].

Supplementary Fig. 3.

Virtual coronal re-sections through HREM data of wild-type E14.5 mouse embryos. Selected important features are labelled. **a.** Re-section through the embryo displayed in the inlay on the left. Note the section plane (p). Scalebar = 1 mm. **b.** Magnification of the brain as boxed in a. **c.** Magnification of the region boxed in b. Note the fibers of the internal capsule (ic), choroid plexus (cp) of the 2nd ventricle, and middle cerebral artery (mca). **d.** Magnification of the pelvis as boxed in a. Note the pancreas (pa), kidneys (ki), and right gonad (go). **e.** Magnification of the region boxed in d. Note the para-aortic bodies (pmg), ureter (ur), and abdominal aorta (aa). **f.** brain, palatine (pa), and eye (eb). Note the forming caudate nucleus (ca) and thalamus (th). **g.** cranial nerve 7 (VII). Inlay shows a close up of the nerve (arrowhead), where it leaves the rhombencephalon (rho). **h.** Cranial nerve 8 (VIII). Pars cochlearis fibers enter the modiolus of the cochlea (co).

[aa, abdominal aorta; am, abdominal muscles; ca, caudate nucleus; co, cochlea; cp, choroid plexus; cv, cardiac ventricle; di, diencephalon; dp, diaphragm; eb, eye; em, eye muscles; go, gonad; I, 1st ventricle; ic, internal capsule; if, interventricular foramen; II, 2nd ventricle; ki, kidney; li, liver; le, lens; ma, mandible; mca, middle cerebral artery; md, mesonephric duct; nc, nasal cavity; pa, pancreas; pmg, para-aortic bodies; rho, rhombencephalon; ri1, 1st rib; sc, spinal chord; se, semicircular canals; sto, stomach; tel, telencephalon; th, thalamus; to, tongue; ul, upper limb; ur, ureter; vc, body of vertebra; VII, cranial nerve 7; VIII, cranial nerve 8].

Supplementary Fig. 4.

Flow diagram of phenotyping protocol. Analysis proceeds from initial examination of embryo external appearance from 3D modelling to systematic examination of the HREM section image stack (in an overall rostrocaudal sequence). Organs and tissues to be assessed are listed in Table 1. After completion of the axial sequence, Virtual resection data corresponding to sagittal and coronal section planes are similarly reviewed, following the checklists outlined (Table 1).

Supplementary Table 1.

Abnormalities diagnosed in the 34 different mouse strains analysed. Note that, according to their developmental stage, all embryos feature palatine cleft. We have therefore only used this term for embryos of developmental stage 23 (Theiler) with palatine plates lateral to their tongues. In addition, many embryos had remnants of the interventricular foramen, an observation that can be considered normal for the examined stages and is not therefore listed in this table.

| Supplementary Table 1 | | |
|-----------------------|---|-----|
| Gene | Description | No. |
| Agpat3 | Abnormal eye cup morphology | 1 |
| | Shortening of cystic duct | 1 |
| | | |
| Akap9 | Subcutaneous edema | 1 |
| | Perimembranous ventricular septal defect | 1 |
| | Intramural bleeding in descending aorta | 1 |
| | Abnormal vertebral artery topology | 1 |
| | | |
| Aldh18a1 | Subcutaneous edema | 2 |
| | Eye ball inside head mesenchyme | 3 |
| | Absent lens vesicle | 3 |
| | Abnormal eye muscle development (morphology) | 3 |
| | Abnormal nasal cavity morphology | 1 |
| | Absent internal carotid artery segment | 1 |
| | Absent intrahepatic segment of vena cava inferior | 1 |
| | | |
| Amfr | No phenotype | 3 |
| | | |
| Arid2 | Subcutaneous edema | 3 |
| | Exophthalmos | 3 |
| | Degeneration of brain tissue | 1 |
| | Abnormal heart position or orientation | 3 |
| | Perimembranous ventricular septal defect | 3 |
| | Double outlet heart right ventricle | 3 |
| | Double inlet heart left ventricle | 2 |
| | Muscular ventricular septal defect | 3 |
| | Transposition of great arteries | 2 |
| | Biventricular ambiguous atrioventricular connection | 2 |
| | Ostium primum atrial septal defect | 2 |
| | Retroesophageal right subclavian artery | 2 |
| | Retroesophageal left subclavian artery | 1 |
| | Right sided aortic arch | 1 |
| | Vascular ring around esophagus | 1 |
| | Abnormal vertebral artery segments | |

| | | |
|---------------|---|---|
| | Blood in lymph sac | 1 |
| | Abnormal topology of vagus nerve | 3 |
| | Liver hypoplasia | 1 |
| | Liver cysts | 1 |
| | Abnormal liver morphology | 1 |
| | Absence of sternal extremitas of clavicle | 1 |
| | | |
| Arid4a | No phenotype | 3 |
| | | |
| Asxl1 | Holoprosencephaly | 2 |
| | Absent internal capsule | 3 |
| | Abnormal 3 rd ventricle morphology | 1 |
| | Absent olfactory bulb | 1 |
| | Narrow eye opening (or absent) | 2 |
| | Abnormal optic stalk morphology | 3 |
| | Abnormal optic cup morphology | 3 |
| | Anophthalmia | 1 |
| | Absent lens vesicle | 3 |
| | Abnormal eye muscle development | 1 |
| | Abnormal adenohypophysis morphology | 2 |
| | Multiple craniopharyngeal ducts | 3 |
| | Abnormal nasal septum morphology | 1 |
| | Abnormal nasal cavity morphology | 1 |
| | Ostium primum atrial septal defect | 1 |
| | Biventricular ambiguous atrioventricular connection | 1 |
| | Abnormal anterior cerebral artery | 2 |
| | Abnormal vertebral artery topology | 1 |
| | Absent internal carotid artery segment | 1 |
| | | |
| Cbx1 | Subcutaneous edema | 3 |
| | Persisting craniopharyngeal duct | 3 |
| | Abnormal aortic valve cusp morphology | 1 |
| | Abnormal pulmonary valve cusp morphology | 1 |
| | Anastomosis of internal carotid and basilar artery | 2 |
| | Abnormal basilar artery segments | 2 |
| | Abnormal vertebral artery topology | 1 |
| | Aneurysm of ocular artery | |
| | Abnormal vitelline vein connection | 1 |
| | Short cystic duct | 1 |
| | Abnormal small & large intestine placement | 1 |

| | | |
|----------------|--|---|
| | Herniated liver | 1 |
| | Thyroid hypoplasia | 2 |
| | | |
| Cenpj | Subcutaneous edema | 1 |

Supplementary Table 2.

Abnormalities diagnosed in embryos from 34 mutant mouse lines at 14.5 dpc, after analysis by HREM. Phenotype terminology is according to systematic MP lists (<http://www.ebi.ac.uk/ontology-lookup/browse.do?ontName=MP>). Note the brief anatomical description, which specifies or extends the abnormality if MP terms are not sufficiently descriptive. Column L (lethality): estimate of severity of defects according to the categories Sc1-Sc5 defined in the text. Column Q: estimate of data quality and resolution at which the given abnormalities can be diagnosed reproducibly (m: μ MRI data quality and lower; i: intermediate level of data quality; h: histological or HREM level of data quality. Note that diagnosis of certain abnormalities depends on their severity, reflected in estimates i/h, m/h, and m/I (shown in parentheses).
