Distinct Innate Immune Phagocyte Responses to *Aspergillus fumigatus* Conidia and Hyphae in Zebrafish Larvae

Benjamin P. Knox, Qing Deng, Mary Rood, Jens C. Eickhoff, Nancy P. Keller, and Anna Huttenlocher

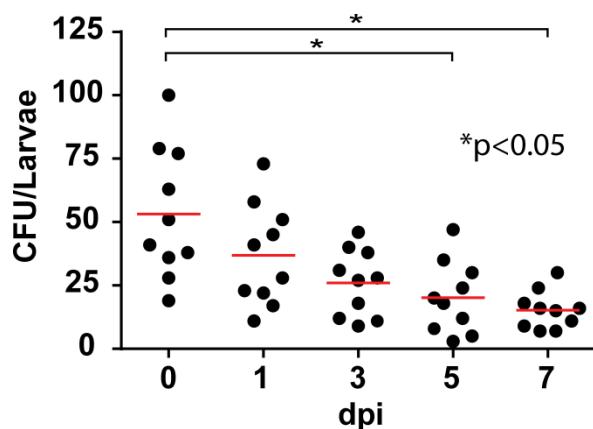

Figure S1. Decrease in *A. fumigatus* CFU's over time from single immunocompetent larvae. Immunocompetent larvae infected with *A. fumigatus* were individually homogenized and plated at the time points indicated showing the spread of original fungal inoculum per larvae and decrease over time. Significant reduction in fungal CFU obtained by days 5 and 7 post infection. Graph representative of data from two independent experimental replicates. *, p<0.05 as determined by Kruskal-Wallis test with Dunn's multiple comparison posttest.

Supplemental Information

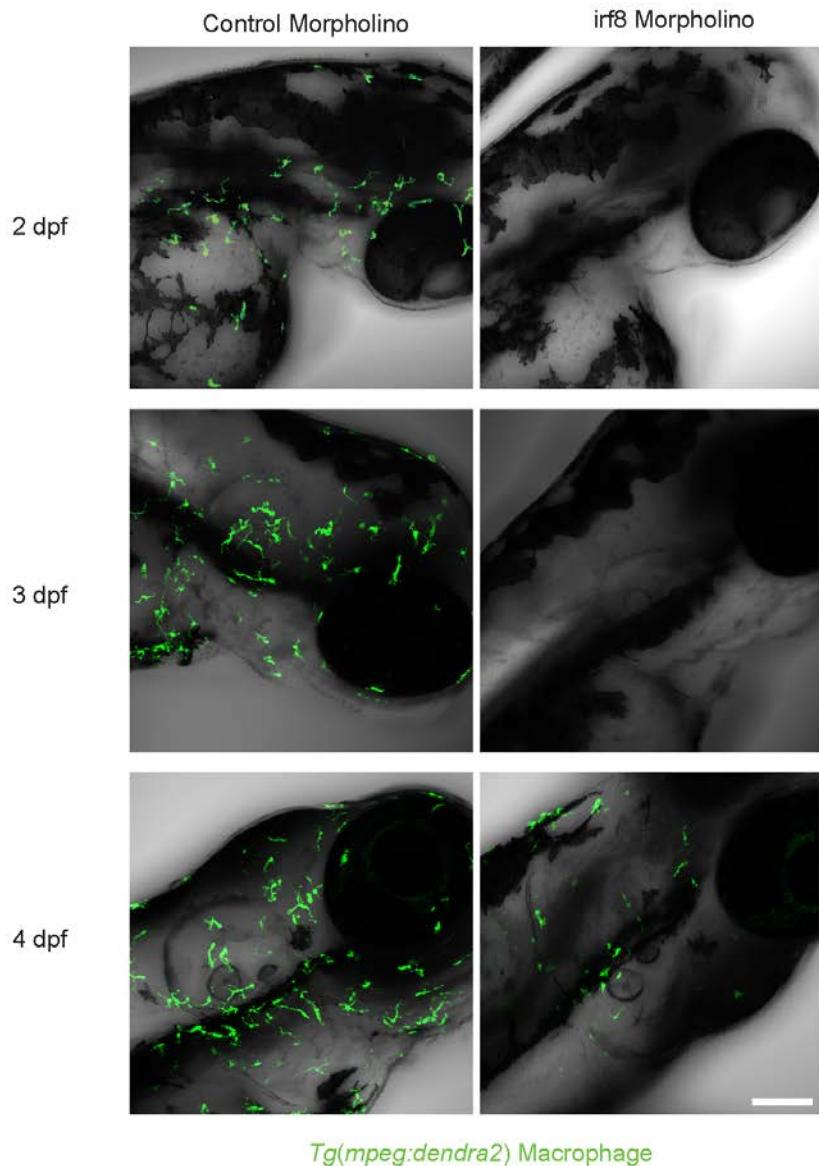

Figure S2. Irf8 morpholino knockdown efficacy over time. Macrophage development in *Tg(mpeg:dendra2)* larvae is completely inhibited with the irf8 morpholino for 3 days post fertilization (dpf). Starting at 4 dpf, macrophages begin to return, albeit in diminished numbers. Scale bar, 100 μm.
