^a From the annotated sequence available at <http://www.tigr.org>. U and D primers are used to clone upstream (U) and downstream (D) sequences of the corresponded sRNAs in order to construct the deletion mutant by a double-crossover. V primers are used to prove the right size of the deletion. P primers are used to clone the promoter regions of the corresponded sRNAs.

^b The underlined sequences are restriction enzyme recognition sites.

Table S2. List of putative targets up-and down-regulated in the sRNA mutant strains identified by proteomic analysis.

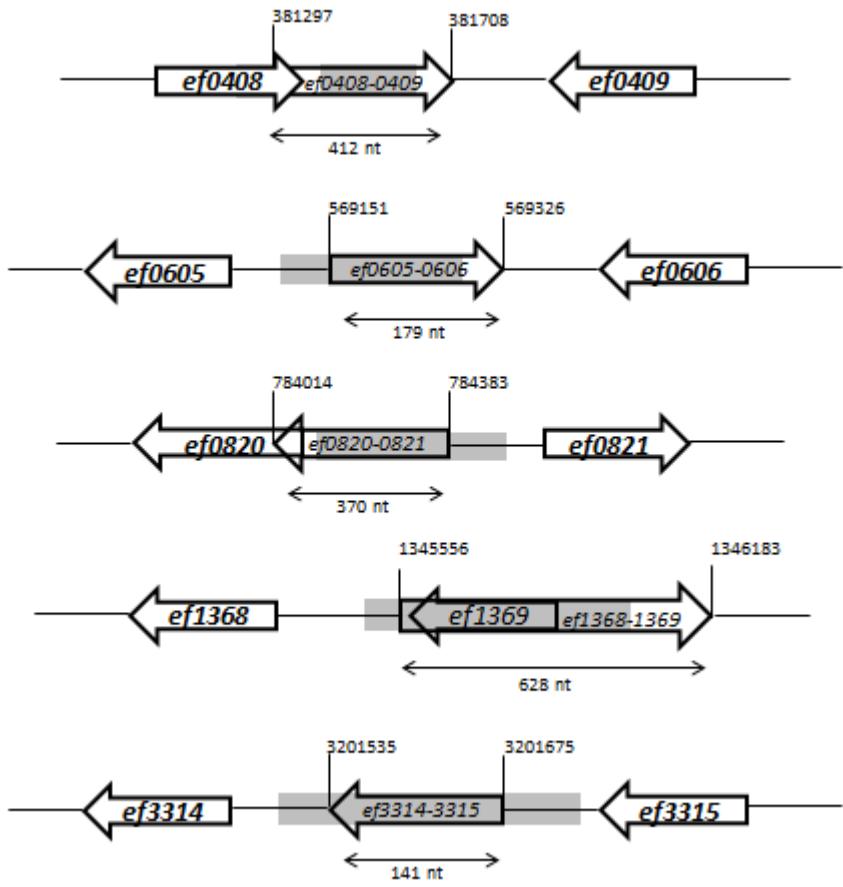

Figure S1. Schematic view of the studied sRNAs. For each sRNA, upstream and downstream genes are written in bold and represented by arrows. Their orientations show the transcriptional direction. The two numbers flanking each sRNA arrow correspond to sRNAs coordinates. Grey areas represent the part removed to obtain the different sRNA mutant strains.

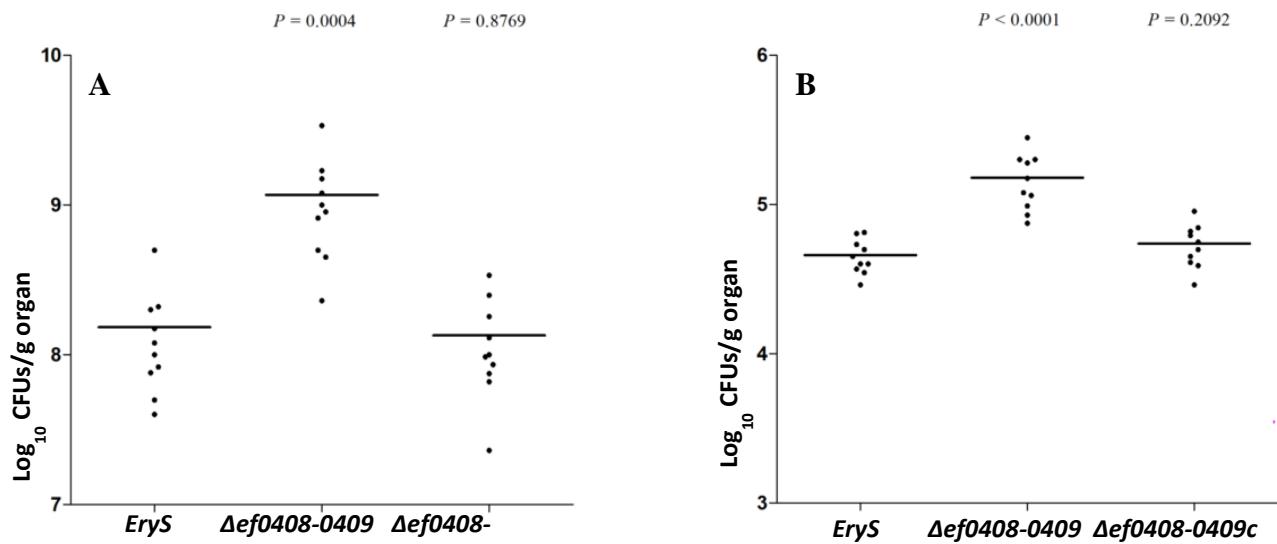

Figure S2. Bacterial persistence within mouse organs in systemic infection. Enterococcal tissue burdens in kidneys and in livers from BALB/c mice infected intravenously with 1×10^9 bacteria/ml of the EryS wild-type, the $\Delta\text{ef}0408-0409$ mutant and the complemented strains are shown. Kidney pair (A) and liver (B) homogenates were obtained from groups of 10 mice sacrificed and necropsied at day 7 post-infection. The results, expressed as \log_{10} CFU per gram of tissue, represent values recorded separately for each of the 10 mice. Horizontal bars represent the geometric means. P values of less than 0.05 were considered to be significant.

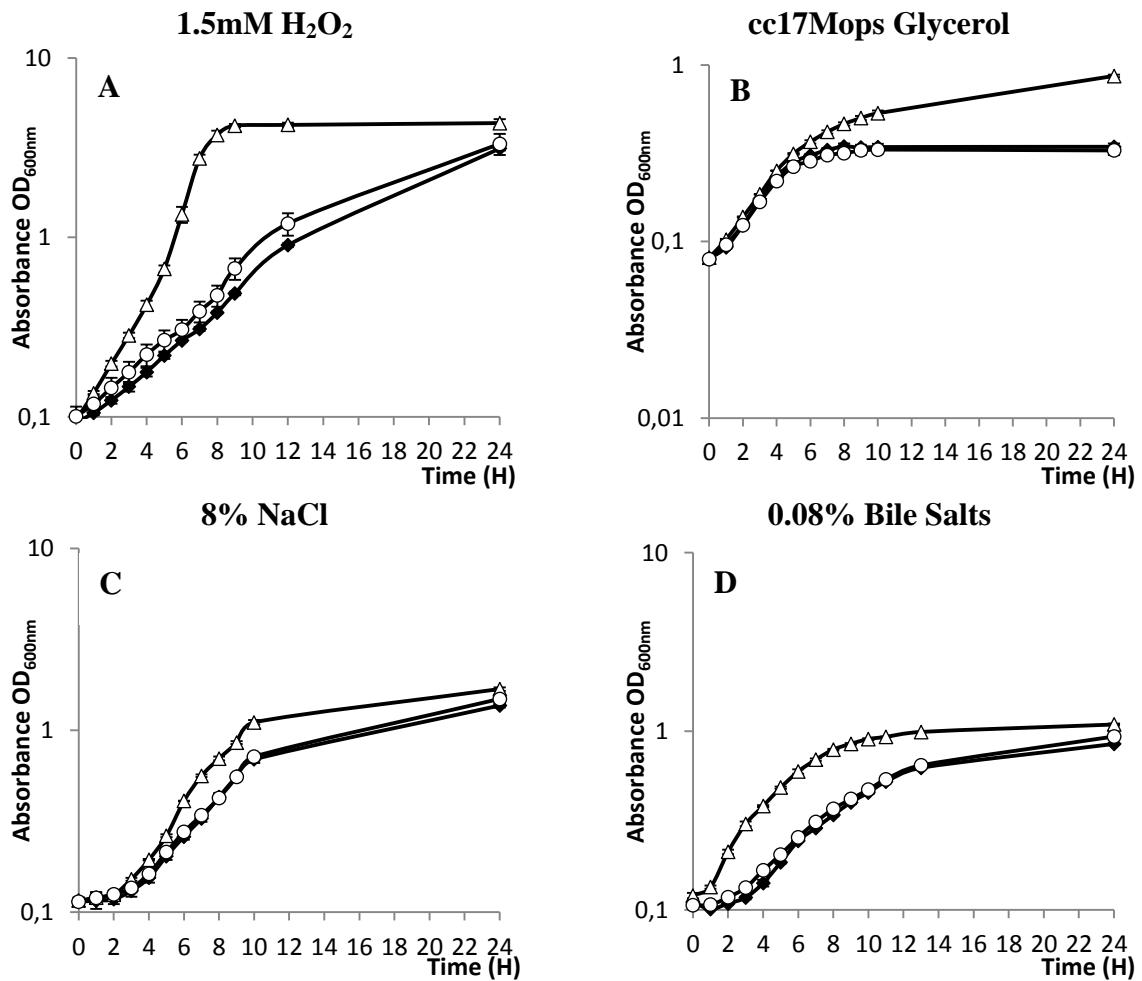

Figure S3. The *E. faecalis* wild-type (black diamonds), the Δ ef0408-0409 sRNAs mutant (white triangles) and the complemented (white circle) strains were grown in GM17 medium supplemented by 1.5mM of H₂O₂ with shaking (A), in cc17MOPS medium supplemented by glycerol with shaking (B), in GM17 medium supplemented by 8% of NaCl (C) or by 0.08% of Bile salts (D) and optical density at 600 nm (OD₆₀₀) was determined. The curves shown represent the average of, at least, three independent experiments and the results represent the means \pm standard deviations.

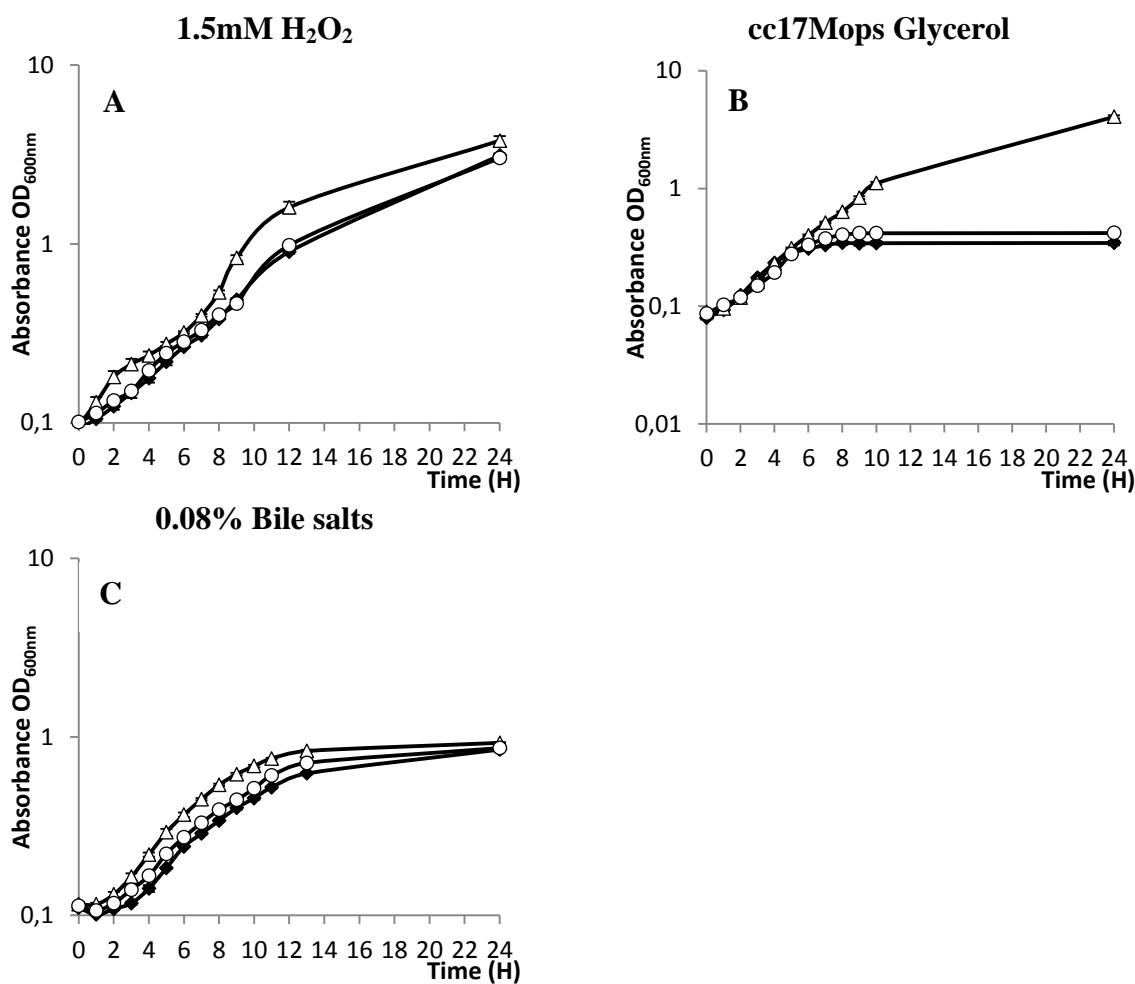

Figure S4. The *E. faecalis* wild-type (black diamonds), the $\Delta ef0605-0606$ sRNAs mutant (white triangles) and the complemented (white circle) strains were grown in GM17 medium supplemented by 1.5mM of H₂O₂ with shaking (A), in cc17MOPS medium supplemented by glycerol with shaking (B) and in GM17 medium supplemented by 0.08% of Bile salts (C) and optical density at 600 nm (OD₆₀₀) was determined. The curves shown represent the average of, at least, three independent experiments and the results represent the means \pm standard deviations.

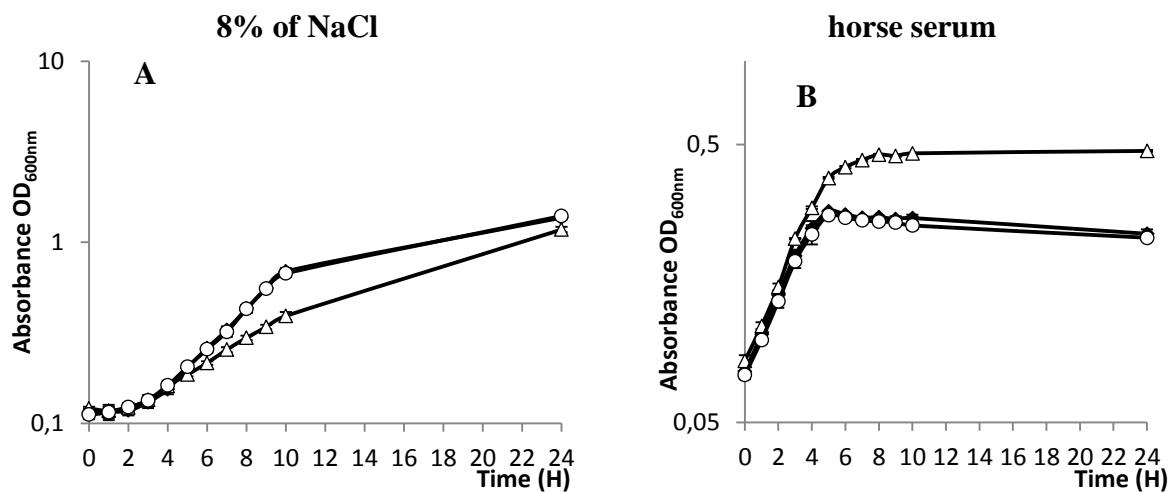

Figure S5. The *E. faecalis* wild-type (black diamonds), the $\Delta ef1368-1369$ sRNAs mutant (white triangles) and the complemented (white circle) strains were grown in GM17 medium supplemented by 8% of NaCl (A), in horse serum (B) and optical density at 600 nm (OD₆₀₀) was determined. The curves shown represent the average of, at least, three independent experiments and the results represent the means \pm standard deviations.

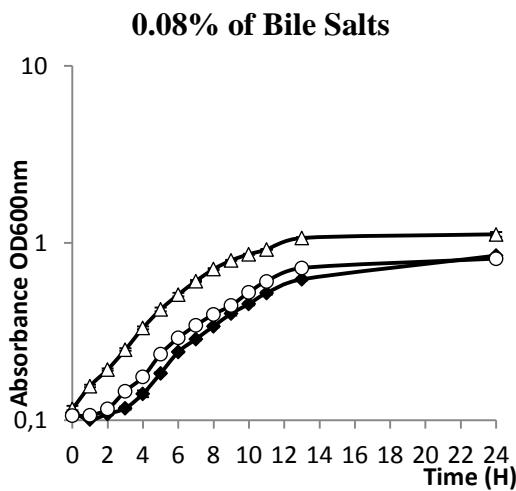

Figure S6. The *E. faecalis* wild-type (black diamonds), the $\Delta ef3314-3315$ sRNAs mutant (white triangles) and the complemented (white circle) strains were grown in GM17 medium supplemented by 0.08% of Bile salts and optical density at 600 nm (OD_{600}) was determined. The curves shown represent the average of, at least, three independent experiments and the results represent the means \pm standard deviations.

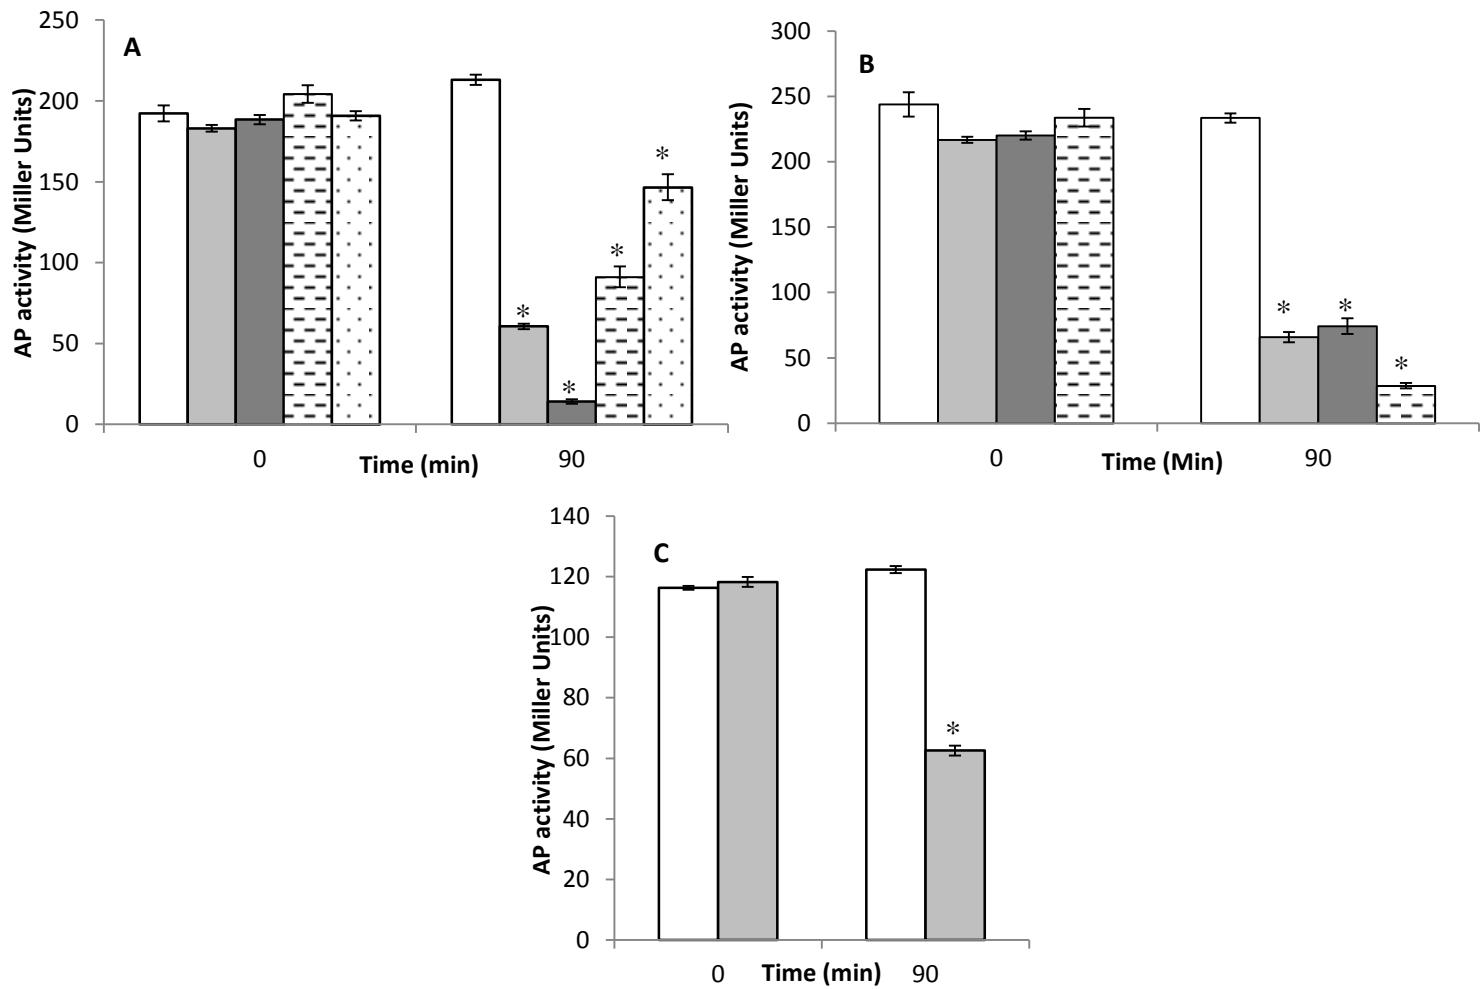

Figure S7. Quantitative assays of AP activity under osmotic, oxidative, detergent and acid stresses conditions of transcriptional fusion constructions.

Cells of pVEPhoZPef0408-0409 strain (A), (where *phoZ* transcription is under the control of *ef0408-0409* promoter), pVEPhoZPef0605-0606 strain (B), and pVEPhoZPef3314-3315 strain (C) grown at mid log phase were subjected to the following conditions (control, white bars), 0.08% of bile salt (grey bars), 1.5mM of H₂O₂ (dark grey bars), Glycerol (dashed bars) and 8% of NaCl (dotted bars). Error bars represent standard errors of at least three independent experiments. P-values of less than 0.001 (*) for the comparison of the same condition at T0 and T90 were considered to be significant.

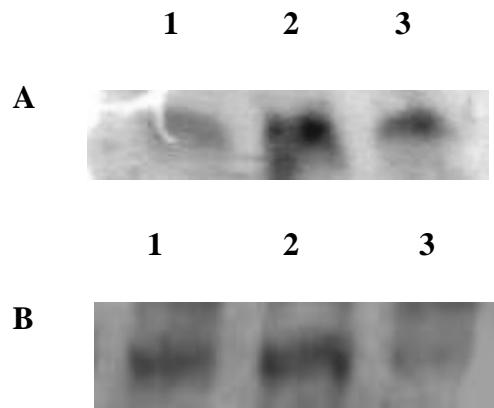

Figure S8. Western blot analysis with polyclonal antibody against Ers (A) and GroEL (B) of *E. faecalis* wild type (lines A1 and B1), $\Delta ef0408$ - 409 mutant (lines A2 and B2), $\Delta ef0605$ - 0606 mutant (line A3) and $\Delta ef3314$ - 3315 mutant (line B3). Protein extracts (40 μ g) were obtained from cells harvested at OD_{600nm} of 0.5.
