

Result of Figure S2; Serum concentrations of OVA-specific IgE Abs of EW-fed normal OVA23-3 mice.

Serum OVA-specific IgE responses were increased ($P < 0.01$) on day 21 compared with the level before receiving EW diet. On day 28, the IgE responses were significantly ($P < 0.05$) decreased compared with the level on day 21, but still elevated higher ($P < 0.05$) than the level before receiving EW diet (Figure S2).
