

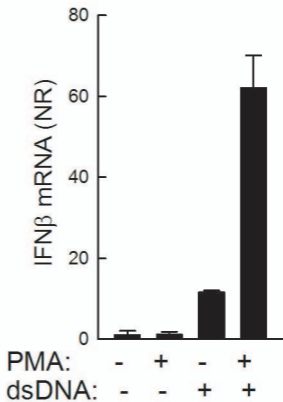

Figure S4

Supplementary Figure S4. Differentiation of THP1 cells with PMA elevates responsiveness to DNA. Parental THP1 cells or PMA-differentiated THP1 macrophages were stimulated with 2 $\mu\text{g/ml}$ of dsDNA or lipofectamine control for 6 h. Total RNA was isolated and IFN β mRNA expression was evaluated by RT-qPCR. Data were normalized to β -actin and presented as means of triplicates \pm SD.
