L.mono.			

Supplementary Figure S7. cGAS and STING co-localize in the cytoplasm after L. *monocytogenes* infection. PMA-differentiated THP1 macrophages were transfected with 2 μ g/ml of dsDNA, 3.6 μ M of cyclicdi-AMP or infected with L. *monocytogenes* (strain LO28, MOI25). Four hours post-treatment the cells were fixed and stained with anti-cGAS and anti-STING antibodies. DNA was visualized by DAPI (blue). Scalebar, 5 μ m.
