

Appendix

Supplemental figure 1 Specific preabsorption of antibodies against FSPs. Representative serum reactive against TGFBR2(-1) and TGFBR2(-1)-C (A) and against TAF1B(-1) (B). ELISA results with different peptides as target antigens (A1-4; B1-3) after preincubation (blocking) of serum with different peptides at different concentrations (1-100 µg/ml). Preincubation of serum with TGFBR2(-1) and TGFBR2(-1)-C (A1, A3) and TAF1B(-1) (B1), decreases reactivity against the respective peptides while preincubation with other peptides does not show an effect.
