**Video S1.** The subject was examined and videotaped at the age of 34.

**Video segment 1** shows the subject with severe dementia, aphasia, aggressive behaviour, repetitive stereotyped movements (hand-wringing and foot-stamping) and disinhibition.

**Video segment 2** shows motor features with a parkinsonian gait (either induced or aggravated by neuroleptics), mild antecollis, head tilt, and difficulties when climbing stairs.
