SI Materials and Methods

Bacterial Strains and Growth Conditions. The bacterial strains and plasmids used in this study are listed in SI Appendix, Table S2. *Burkholderia glumae* BGR1 and two QS-defective mutants, BGS2 (BGR1 *tofI*::Ω) and BGS9 (BGR1 *qsmR*::Ω), were grown in LB broth (0.1% tryptone, 0.5% yeast extract, and 0.5% NaCl [all w/v]; USB Corp., Cleveland, OH) or in LB broth buffered with 100 mM HEPES (pH 7.0) (BLB) at 37°C.

Generation of the S9C17 and KJ1120 Strains. For genetic complementation of the *qsmR* mutant BGS9, we mutagenized the mutant by mini-Tn5rescue (1) to integrate *qsmR* into the genome as a single copy. A single copy of the *qsmR* gene was inserted in the intergenic region between *bglu_2g019970* and *bglu_2g01980* in chromosome 2 of the *qsmR* mutant BGS9, resulting in S9C17. The *ptsI* mutant KJ1120 (BGR1 *ptsI*::mini-Tn5rescue) was constructed as previously described (1). Mini-Tn5rescue was inserted at the 3' end of *ptsI* gene (between 1,577 and 1,578 bp in a total length of 1,770 bp), which disrupted a PEP-utilizers_C domain (2).

Statistical Analyses. The JMP 10 statistical software for Windows (SAS Institute Inc., Cary, NC) was used for all statistical analyses. A one-way analysis of variance was used to detect significant differences among the levels of intracellular metabolites of *B. glumae* BGR1 (wild-type), BGS2 (BGR1 *tofI*::Ω) and BGS9 (BGR1 *qsmR*::Ω). A one-way analysis of variance was used to detect significant differences among the growth rates of *B. glumae* BGR1 and two QS-defective mutants, BGS2 (BGR1 *tofI*::Ω) and BGS1 (BGR1 *tofR*::Ω) in the absence and presence of C8-HSL, and BGS9 (BGR1 *qsmR*::Ω), and S9C17 (BGR1 *qsmR*::Ω/*qsmR*) during the exponential growth stage. Student's t-test was used to identify significant differences between sample pairs. A p-value < 0.05 was considered to indicate statistical significance.

RNA isolation and quantitative reverse transcription-polymerase chain reaction (qRT-PCR). Total RNAs from *B. glumae* BGR1 and two QS-defective mutants, BGS2 (BGR1 *tofI*::Ω) and BGS9 (BGR1 *qsmR*::Ω), grown in LB medium at 37°C for 10 h after subculture, were extracted using RNeasy mini kits (Qiagen) following the manufacturer's protocol. Total RNA was treated with RNase-free DNaseI (Ambion) to remove gDNA. We reverse-transcribed 1-μg amounts of total RNA into cDNA using M-MLV Reverse Transcriptase (Promega) acting for 1 h at 42°C. The primer pairs used in qRT-PCR are listed in SI Appendix, Table S3. 16S rRNA served as a positive control. Transcriptional levels were determined using SsoFast EvaGreen Supermix (Bio-Rad) and a CFX96 Real-Time PCR System (Bio-Rad). The thermal cycling parameters were: 95°C for 30 sec, followed by 40 cycles of 95°C for 5 sec, and 60°C for 5 sec. All PCRs were performed three times, and all data were normalized to the expression levels of the 16S rRNA gene, using Bio-Rad CFX Manager software.

Electrophoretic mobility shift assay. QsmR-His was purified as described previously (1). The upstream regions of putative QsmR target genes were amplified using the primers shown in Table S3. PCR products were labeled with biotin using Lightshift Chemiluminescent Electrophoretic Mobility Shift Assay Kits, as described by the manufacturer (Pierce). We used the 329 bp upstream of *katE1* as a competitor DNA; this was amplified using the KatE1-F and KatE1-R primers, as described previously (see SI Appendix, Table

S3). Purified QsmR-His (500 nM) was incubated in binding buffer [10 mM Tris-HCl (pH 7.5), 100 mM NaCl, 0.5 mM EDTA, 1 mM DTT, 5% (v/v) glycerol, and 10 ng μ l⁻¹ poly (dI-dC)] containing 0.25 nM or 2.5 nM biotin-labeled DNA, for 15 min at 28°C. In competition analyses, unlabeled target DNA at 10–20-fold molar excess was added to each reaction along with the extract, before addition of labeled DNA targets. Reaction mixtures were separated in non-denaturing 4% (w/v) polyacrylamide gels and transferred to nitrocellulose membranes, followed by detection of relevant bands using streptavidin/horseradish peroxidase-derived chemiluminescence kits, as described by the manufacturer (Pierce). Images were visualized using Chemi Doc XRS+ and the Image Lab Software (Bio-Rad).

Table S1. The intracellular metabolite concentrations of *Burkholderia glumae* BGR1 (wild-type) and two QS-defective mutants, BGS2 (BGR1 *tofL*::Ω) and BGS9 (BGR1 *qsmR*::Ω), grown in LB broth or in LB broth buffered with 100 mM HEPES (pH 7.0) at 37°C.

Metabolite	Concentration (pmol/10 ⁹ cells)								
	Mid-exponential growth stage in LB (6 hrs after subculture)			Late-exponential growth stage in LB (10 hrs after subculture)			Late-exponential growth stage in BLB (10 hrs after subculture)

Fig. S5. Statistical analysis of differences in the levels of intracellular metabolites. Metabolite levels in the wild-type BGR1, the *tof*/*mutant* BGS2, and the *qsmR* mutant BGS9 grown in LB broth or LB broth (BLB) supplemented with 100 mM HEPES for 6 or 10 h were measured by capillary electrophoresis time-of-flight mass spectrometry. The metabolites measured were as follows. 3-Hydroxybutyric acid, Divalent Acetyl CoA, Adenine, Adenosine, ADP, Ala, AMP, Arg, Asp, ATP, Betaine, cAMP, CDP, Choline, Citric acid, Citrulline, CMP, CTP, Cytidine, Cytosine, dATP, dTTP, Fructose 6-phosphate, GABA, GDP, Gln, Glu, Gluconic acid, Glucose 1-phosphate, Glucose 6-phosphate, Divalent Glutathione (GSSG), Gly, Glycerol 3-phosphate, Glyoxylic acid, GMP, GTP, Guanosine, His, Homoserine, Hypoxanthine, Ile, Lactic acid, Leu, Lys, Malic acid, NAD⁺, NADP⁺, Ornithine, Phe, Pro, Putrescine, Ribulose 5-phosphate, Sedoheptulose 7-phosphate, Ser, Succinic acid, Thr, Trp, Tyr, UDP, UMP, UTP, Val, β-Ala, 2-Phosphoglyceric acid, 3-Phosphoglyceric acid, 6-Phosphogluconic acid, Anthranilic acid, Asn, cGMP, dCTP, Dihydroxyacetone phosphate, dTMP, Phosphoenolpyruvic acid, and Ribose 5-phosphate.

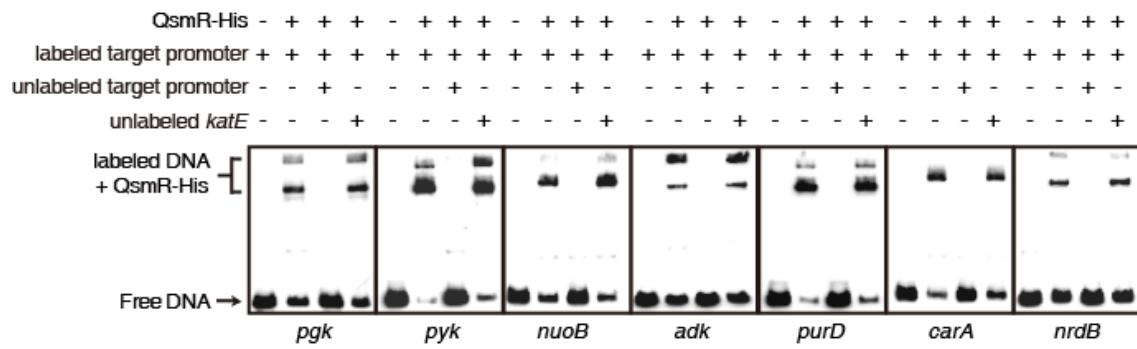

Fig. S6. Direct binding of QsmR to the promoter regions of the *pgk*, *pyk*, *nuoB*, *adk*, *purD*, *carA*, and *nrdB* genes.
