

SUPPLEMENTARY FIG. S5. In 3D Matrigel, epithelial cysts are derived from EpCAM^{pos} cells. Equal numbers of EpCAM^{pos} and EpCAM^{neg} cells isolated using MACS strategy were isolated from transgenic CAG-EGFP animals and co-cultured with wild-type lung EpCAM^{neg} cells. Cultures were fixed at day 21 after plating, and sections were stained with antibodies against E-cadherin (*red*). Scale bar, 100 μ m.
