General Methods

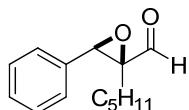

General Methods. All reactions were carried out under an atmosphere of argon in flame dried glassware with magnetic stirring. Toluene was degassed with argon and passed through one column of neutral alumina and one column of Q5 reactant. Column Chromatography was performed on 40-63 μ m 60A silica gel. Thin layer chromatography was performed on 250 μ m 60A plates. Visualization was accomplished with UV quench, KMNO₄, or aqueous ceric ammonium molybdate dips followed by heating. Data are reported as follows: chemical shift is parts per million (δ , ppm) from chloroform, (CHCl₃) taken as 7.26 ppm, integration, multiplicity (s = singlet, br s = broad singlet, br d = broad doublet, d = doublet, t = triplet, q = quartet, qint = quintet and m = multiplet), and coupling constants (Hz). ¹³C NMR spectra, chemical shifts are reported in ppm from CHCl₃ taken as 77.0 ppm. Mass spectra were obtained on a Fisions VG Autospec.

α,β -Epoxy aldehydes were prepared according to literature procedure from the corresponding allylic alcohol. Compounds **4a**,¹ **4g**,¹ match spectrometric data and physical properties to those previously reported in the literature. Azidotrimethylsilane (95%) and sodium azide were purchased from Aldrich Chemical Co. and used without further purification. Triethylamine was purified by distillation over Calcium hydride.

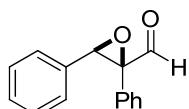

Hydrazoic acid is generated *in situ* by treatment of azidotrimethylsilane (0.042 g, 0.370 mmol, 1.05 equiv) and ethanol (0.018 g, 0.39 mmol, 1.1 equiv) in 1 ml of toluene which is stirred for 30 min in a sealed round bottom flask under an argon atmosphere prior to use.

Compounds **17a**,³ **17b**,³ and **17c**⁴ match spectroscopic data and physical properties to those previously reported in the literature.
