Causal Inference Test (CIT) was used to test if associations between SNPs identified in the *cis*-mQTL analysis and islets insulin secretion was mediated by DNA methylation of CpG sites.

G vs M: Adjusted associations between genotype (G) and DNA methylation (M) – *cis*-mQTL analysis. P-values corrected for multiple testing based on number of independent tests performed.

G vs I: Adjusted associations between genotype (G) and human islet insulin secretion measured as stimulation index (I).

CIT: Causal hypothesis P-value < 0.05 showing that genotype (G) and islet insulin secretion (I) relationship is considered mediated through DNA methylation (M).
